Abstract

This technical report presents results from a cross-validation study designed to identify optimal cut scores when using easyCBM[®] reading tests in Oregon. The cross-validation study analyzes data from the 2009-2010 academic year for easyCBM[®] reading measures. A sample of approximately 2,000 students per grade, randomly split into two groups of roughly the same size, was used for this study. Students state test performance classification (passing/not passing) on the Oregon Assessment of Knowledge and Skills (OAKS) was used as the criterion. Optimal cut scores were identified for each of the randomly split groups with a receiver operating characteristic curve (ROC) analysis. Results indicated reasonably stable cut scores between groups. Further, the overall area under the ROC curve (AUC) was not statistically different between groups for any measurement occasion at any grade, providing strong evidence for the validity of identified cut scores as optimal to predict student performance classification on the Oregon state large-scale assessment.

A Cross-validation of easyCBM Reading Cut Scores in Oregon: 2009-2010

In this technical report, we present findings from a cross-validation study examining the diagnostic efficiency of easyCBM® reading tests. Data for these tests were analyzed for grades 3-8, and came from the 2009-2010 academic year. Park, Anderson, Irvin, Alonzo, and Tindal (2011) used a large sample in Oregon to establish optimal cut scores for predicting performance classification (not passing/passing) on the reading portion of the Oregon Assessment of Knowledge and Skills (OAKS), the state test used in Oregon. We extend their study by randomly splitting the same sample into two groups and examining the stability of the optimal cut scores for each easyCBM® reading measure across the randomly selected groups. The relative stability of the cut points provides further evidence to support the specified cut point for predicting state test classification in Oregon.

Theoretical Framework

The online easyCBM® progress monitoring assessment system was launched in September 2006 as part of a Model Demonstration Center on Progress Monitoring funded by the Office of Special Education Programs (OSEP). Since 2006, up to 17 forms for each reading measure have been developed for grades K-8. These reading measures accompany the 33 test forms available at each of grades K-8 for mathematics, together making up the easyCBM® online assessment system.

The easyCBM® reading measures were developed specifically for use within a response to intervention (RTI) framework. Within RTI, students are administered benchmark screening assessments periodically throughout the year (e.g., fall, winter, and spring). From these benchmark assessments, students are classified into tiers of “academic risk,” typically based on normative cut scores. For example, a district using easyCBM® may administer the reading assessments in the fall for benchmark screening purposes. Based on student results on these

screening tests, and on a set of performance-associated normative risk ratings that the district identifies for each measure, students are classified into one of two tiers of risk (Tier 1: *not at-risk* or Tier 2: *at risk*). Students identified as *at-risk* on one or more easyCBM® reading assessments are then provided with a targeted academic intervention, and their progress is monitored with frequent easyCBM® administrations. The progress-monitoring probes are administered until the student (a) has responded to the intervention and is placed back in Tier 1, or (b) the subsequent benchmarking occasion, at which point tier placement is re-evaluated.

Although many districts operate under a normative evaluation of student achievement when assigning tier placement, a criterion-referenced view may provide additional useful information. For example, a district may know that students scoring an 8 or below on a particular screener are below the 20th percentile. However, from a criterion-referenced view, the district may also take into account that students scoring an 11 or below are not likely to pass the state test. A score of 11 may be closer to the 30th percentile of normative achievement. The educators within the district can then determine what the most optimal cut-point would be for their district given the resources available, weighing both the normative and criterion-referenced interpretations of student achievement.

The easyCBM® system has three designated benchmark screening assessments for reading, administered during the fall, winter, and spring for fluency and comprehension, and during fall and spring for vocabulary. The remaining reading assessment forms for a given measure and at a given grade are designated for progress-monitoring between the seasonal benchmark assessments. Although ostensibly low-stakes in nature, perhaps the most critical assessment occasion for easyCBM® reading assessments is the fall benchmark screener. As in the example above, the results from the fall benchmarks are used to initially classify students into

RTI tiers, from which two types of errors can occur: false positives and false negatives. A false positive occurs when a student is incorrectly identified as being *at-risk*, while a false negative occurs when a student is incorrectly identified as being *not at risk*. From an instructional standpoint and within the RTI model, false negatives are of far greater concern than false positives. Students who are not identified as *at-risk* when they should be are provided only typical grade-level instruction and are not tested again until the next benchmark screening in the winter. In other words, when a false negative occurs, students may be excluded from potentially valuable reading interventions for months, unless their teacher or a separate measure deems them *at-risk*. In contrast, false positives result in providing targeted interventions to students who are not necessarily in need. In the case of a false positive, additional interventions given to students not in need can be a drain on instructional resources.

Although false positives may drain limited resources, they are not as great a concern as false negatives because students receiving unneeded additional support are also administered additional progress-monitoring measures. Thus, students who are not in need of the additional support will likely be correctly reclassified as being *not at-risk* based on results from additional progress monitoring assessments, whereas students misclassified by false negatives may spend much of the school year not receiving instructional interventions they need to improve their reading. Given the importance of the instructional decisions made based on student performance on the easyCBM® benchmark reading measures and the inherent complexity around identifying a student as being at-risk, it is important to scrutinize potential easyCBM® cut scores used for classifying students.

We examine raw score cut points on easyCBM® benchmarks with a criterion-referenced evaluation, determining how well each score predicts performance-level classification on the

reading portion of the OAKS. Park et al. (2011) established optimal raw score cut points, and we extend this work by conducting a cross-validation study to explore the stability of optimal cut scores when the sample is randomly split into two similar groups. Therefore, we examine and report only the diagnostic efficiency information obtained from the receiver operating characteristics (ROC) curve analysis (including the ROC curve figure, area under the curve statistics, and the sensitivity and specificity of each cut score), and not other classification statistics such as the positive and negative predictive power, or overall correct classification rate. Readers are referred to Park et al.'s (2011) technical report for this information.

Methods

Setting and Subjects

Three districts participated in this study. The demographics and number of students in the full sample are reported by grade level in Table 1 and by district in Table 2. Two of the three participating districts have implemented a district-wide response to intervention (RTI) program. As part of this program, all students, including English language learners and/or students with learning disabilities, are assessed using seasonal easyCBM® benchmark screeners. All students in these two districts who were present on the day of testing were included in the study. The third district administered the easyCBM® benchmark assessments to a subset of classes selected to match overall district demographics.

Measures

In this section, we begin by first describing the easyCBM® reading benchmark screening assessments under investigation. We then describe the state test, used as the criterion to determine students “true classification”: the OAKS.

For students in grades two through eight, three types of reading measures are available through easyCBM®: fluency, comprehension, and vocabulary. The fluency and comprehension

measures are administered in the fall, winter, and spring, while the vocabulary measure is administered only in the fall and spring. Both the comprehension and vocabulary easyCBM® measures are computer-based, although teachers have access to printable versions of the tests so they can be administered via paper-pencil. Fluency measures are designed for individual administration, with scores recorded on the computer after student performance has been assessed. All easyCBM® test forms of a specific type and within a grade-level were designed to be of equivalent difficulty. However, no attempt was made to control the difficulty of the measures across different test types (i.e., the comprehension tests are not designed to be of equivalent difficulty to the fluency or vocabulary tests within a given grade level).

Fluency. There are two types of fluency measures available through easyCBM®: word reading fluency (WRF) and passage reading fluency (PRF). The WRF measures are available in grades K-3, while the PRF measures are available in grades 1-8. For the current study, we analyze easyCBM® PRF results only in the grades where the OAKS was administered (3-8). Although some data were available on the WRF measures in grade 3, this measure was not included in the current study. By grade 3 students have typically “graduated” from the WRF measures to the PRF measures, and very few teachers chose to use WRF for benchmark screening in the study samples.

The PRF measures consist of an original work of fictional narrative varying in length from 250 to 380 words, depending on the grade-level. Students are administered the measures individually by trained assessors. The assessor begins by reading a standardized set of directions and presenting the student with the passage on a single page. The assessor provides one-minute of reading time and scores the number of correctly read words per minute. Words students fail to read or read incorrectly are counted as errors, while self-corrections are scored as correct. A

complete description of the development of the PRF measures can be found in Alonzo, Park, and Tindal (2008), Alonzo and Tindal (2008), and Alonzo and Tindal (2007).

Comprehension. Students' comprehension skills are assessed with the easyCBM® multiple-choice reading comprehension (MCRC) measures. MCRC measures for grades 3-8 contain 20 items assessing students' comprehension of a 1,500 word fictional narrative. The comprehension items are designed to target students' literal (7 items), inferential (7 items), and evaluative (6 items) comprehension. Literal items ask the student to identify a specific event from the text. Inferential questions require students to infer unwritten meaning from the text. For example, a story may describe how a character feels, but not explicitly describe the character's feelings. A typical inferential question might then explicitly ask how the character felt. Evaluative questions ask the reader to evaluate the situation and make a judgment. For example, an item may ask what a character in the story would likely do if he or she were in the situation described in the story at another time. Students are allowed to read back through the text as they are answering the items. Each item consists of a question stem followed by three possible answer choices: one correct, one intended as a near-distractor, and one intended as a far-distractor. Each item is worth one point for a total possible raw score of 20. Additional description of the development of the MCRC measures can be found in Park, Alonzo, and Tindal (2011) and Alonzo, Liu, and Tindal (2007).

Vocabulary. The vocabulary (VOC) measures available through easyCBM® contain 25 multiple-choice items. The stem of each item consists of a single vocabulary word targeted at the students' grade level. Various word-lists were used during development to determine appropriate words (e.g., Fry, EDL Core Vocabulary, etc.). Each item contains three answer options consisting of a correct response and two relevant distractors. The correct response was the

second most-common synonym of the word as indicated in the dictionary. Complete description of the development of the VOC measures can be found in Alonzo and Tindal (2004).

Oregon Assessment of Knowledge and Skills (OAKS)

The OAKS is a 50-item fixed-length computer-adaptive test. Students are allowed to take the test anywhere from 1-3 times during the school year, with their highest score retained for accountability purposes. The OAKS reading test has six score reporting categories: (a) vocabulary, (b) read to perform a task, (c) demonstrate a general understanding, (d) develop an interpretation, (e) examine content and structure of informative text, and (f) examine content and structure of literary text. The percentages of each item type are differentially weighted across grades (for specific weighting, see ODE, 2011). The items targeting *develop an interpretation* are closely related to what easyCBM® refers to as inferential type questions on MCRC tests, while the items targeting *examine content and structure of literary text* are closely related to easyCBM® evaluative type questions on the MCRC. All items have four response options with one correct response and three distracters. Students' scores are reported in Rasch units, a continuous scale ranging from 0 to infinity. The Rasch unit scale accounts for students' response to items relative to the item difficulty. According to the Oregon Department of Education, most scores range from 150 – 300 (Oregon Department of Education, 2010). The *meeting* scores for the OAKS reading test in grades 3-8 for 2010 were 204, 211, 218, 222, 227, and 231 respectively.

Data Analyses

To evaluate the stability of the optimal cut scores selected for each easyCBM® measure, we randomly split the sample into two similar groups. After each group was selected, we followed a two-stage process. First, we evaluated the groups to ensure that the random group

selection resulted in two demographically comparable samples. Second, we conducted receiver operating characteristic curve (ROC) analyses with each group for each measure at each time-point. The results of the ROC analyses were then used to select an optimal cut-score for each group. The stability of the optimal cut-scores across the randomly selected groups was then compared.

Random Split-File. Groups were randomly split into two groups using the random sample selection function in SPSS 18.0, by which each case is randomly assigned a value based on the specified probability parameter of 0.5, giving each student case an equal probability of being assigned to either group. We then conducted a series of *t*-tests with student subgroups to determine whether the students from a particular subgroup differed significantly between the randomly selected groups. In addition, we conducted *t*-tests with each measure used in the study to determine if students' performance differed significantly between the two groups. For these *t*-tests, we analyzed comparability of the samples based on ten student subgroup categories: seven for ethnicity (American Indian/Alaskan Native, Asian/Pacific Islander, Black, Hispanic, White, Multiethnic, and Decline to Identify) and one for each of Special Education; English Language Learner; and economically disadvantaged students (determined by free or reduced priced lunch eligibility).

ROC Analyses. When *t*-test results indicated that the randomly selected groups were comparable, we conducted a ROC analysis for each measure and grade for each randomly selected half of the sample. We examined the overall AUC for comparability between the groups, with respect to a 95% confidence interval. Overlapping confidence intervals indicated a non-significant difference between the randomly selected groups. We then evaluated the sensitivity and specificity of each cut score and chose an optimal cut score for each group, using

the same approach described in the study by Anderson, Alonzo, and Tindal (2010).

These decision rules applied a slightly modified version of the decision rules outlined by Silbergliitt and Hintze (2005). Silbergliitt and Hintze aimed to maximize both sensitivity and specificity, but placed an increased emphasis on sensitivity. When determining an optimal cut score, they suggest the researcher:

- (a) determine the cut score(s) that yield at least 0.7 for sensitivity and specificity; (b) if possible, increase sensitivity from this point, continuing upward while still maintaining specificity of 0.7, stopping if sensitivity exceeds 0.8; (c) if sensitivity exceeds 0.8 and specificity can still be increased, continue to maximize specificity (while maintaining sensitivity of 0.8); and (d) if both sensitivity and specificity exceed 0.8, repeat steps 2 and 3, using 0.9 as the next cutoff (p. 316).

We felt that if both sensitivity and specificity were above 0.8, that cut score would be the best option. However, if no cut score resulted in both sensitivity and specificity being above 0.8, sensitivity was maximized while keeping specificity above 0.7, even if a different cut score would have resulted in both statistics being close to 0.8. These modified rules placed a further emphasis on sensitivity, which we felt was warranted given the importance of reducing false negatives in an RTI model.

Results

We present the results of this cross-validation study in two sections: (a) sample comparisons of demographic characteristics between the two randomly split groups, and (b) optimal cut scores and ROC analyses for both groups.

Section One: Sample Demographic Comparisons

Sample characteristics were compared based on the proportion of each student subgroup and the descriptive statistics of each measure. The *t*-test results indicated that across all grades, the two groups did not differ significantly based on demographic characteristics with two exceptions: the proportion of students who declined to identify their ethnicity in grade 4, $t(3640) = -2.16, p = .031$ and the proportion of students receiving free or reduced priced lunch in grade 5, $t(2140) = 1.98, p = .047$. Although *t*-tests indicated statistically significant differences in these two instances, examination of the descriptive statistics related to each group indicated that the differences between the two groups in the two aforementioned categories were minimal. Thus, we concluded that student demographic characteristics across the two randomly split groups were sufficiently similar for cross-validation analysis of identified optimal cut scores between the groups. The results of the comparison of sample demographic characteristics between the two groups are presented, by grade, in Appendix A.

Section Two: ROC Analyses and Optimal Cut Scores

ROC analysis computes sensitivity and specificity statistics for all possible cut scores in half-point increments. When selecting an optimal meeting score, the next highest whole number of a chosen cut score is reported, serving as the basis for student classification. For example, given a cut score value of 9.5 on a benchmark vocabulary measure, students who score 9 or below would be classified as at-risk of failing to meet the state standard, whereas students who score 10 or above would be classified as not at-risk. In this case, 10 would be reported as an optimal *meeting* score for this measure. The chosen meeting cut scores for each measure yielded the most optimal sensitivity and specificity statistics based on the decision rules outlined above for the two groups.

Grade 3 results. For students in Grade 3, the optimal meeting score on the easyCBM® fall PRF benchmark test was 61 correct words per minute (CWPM) for the first group and 62 CWPM for the second group. On the fall MCRC benchmark test, the optimal meeting scores were 10 and 9 for the first and the second group, respectively. On the fall VOC benchmark test, the optimal meeting scores were 13 and 14 for the first and the second group, respectively. The optimal meeting score on the easyCBM® winter PRF benchmark test was 89 CWPM for the first group and 90 for the second group. On the winter MCRC benchmark test, the optimal meeting scores were 10 for both groups. The optimal meeting score on the easyCBM® spring PRF benchmark test was 93 CWPM for the first group and 92 CWPM for the second group. On the spring MCRC benchmark test, the optimal meeting scores were 13 for both groups. On the spring VOC benchmark test, the optimal meeting scores were 21 for both groups.

Grade 4 results. For students in Grade 4, the optimal meeting score on the easyCBM® fall PRF benchmark test was 95 CWPM for the first group and 96 CWPM for the second group. On the fall MCRC benchmark test, the optimal meeting scores were 10 and 11 for the first and the second group, respectively. On the fall VOC benchmark test, the optimal meeting scores were 13 and 14 for the first and the second group, respectively. The optimal meeting score on the easyCBM® winter PRF benchmark test was 119 CWPM for the first group and 121 CWPM for the second group. On the winter MCRC benchmark test, the optimal meeting scores were 13 for both groups. The optimal meeting scores on the easyCBM® spring PRF benchmark test were 123 CWPM for both. On the spring MCRC benchmark test, the optimal meeting scores were 12 and 13 for the first and the second group, respectively. On the spring VOC benchmark test, the optimal meeting scores were 18 for both groups.

Grade 5 results. For students in Grade 5, the optimal meeting score on the easyCBM® fall PRF benchmark test was 137 CWPM for the first group and 138 CWPM for the second group. On the fall MCRC benchmark test, the optimal meeting scores were 13 for both groups. On the fall VOC benchmark test, the optimal meeting scores were 17 for both groups. The optimal meeting score on the easyCBM® winter PRF benchmark test was 141 CWPM for the first group and 143 CWPM for the second group. On the winter MCRC benchmark test, the optimal meeting scores were 15 and 16 for the first and the second group, respectively. The optimal meeting score on the easyCBM® spring PRF benchmark test was 159 CWPM for the first group and 162 CWPM for the second group. On the spring MCRC benchmark test, the optimal meeting scores were 15 for both groups. On the spring VOC benchmark test, the optimal meeting scores were 20 for both groups.

Grade 6 results. For students in Grade 6, the optimal meeting score on the easyCBM® fall PRF benchmark test was 135 CWPM for the first group and 134 CWPM for the second group. On the fall MCRC benchmark test, the optimal meeting scores were 14 and 15 for the first and the second group, respectively. On the fall VOC benchmark test, the optimal meeting scores were 14 for both groups. The optimal meeting score on the easyCBM® winter PRF benchmark test was 147 CWPM for the first group and 151 CWPM for the second group. On the winter MCRC benchmark test, the optimal meeting scores were 14 and 13 for the first and the second group, respectively. The optimal meeting score on the easyCBM® spring PRF benchmark test was 152 CWPM for the first group and 156 CWPM for the second group. On the spring MCRC benchmark test, the optimal meeting scores were 15 for both groups. On the spring VOC benchmark test, the optimal meeting scores were 15 for both groups.

Grade 7 results. For students in Grade 7, the optimal meeting score on the easyCBM® fall PRF benchmark test was 145 for the first group and 143 for the second group. On the fall MCRC benchmark test, the optimal meeting scores were 13 and 14 for the first and the second group, respectively. On the fall VOC benchmark test, the optimal meeting scores were 13 for both groups. The optimal meeting scores on the easyCBM® winter PRF benchmark test were 160 CWPM for both groups. On the winter MCRC benchmark test, the optimal meeting scores were 15 for both groups. The optimal meeting score on the easyCBM® spring PRF benchmark test was 153 CWPM for the first group and 152 CWPM for the second group. On the spring MCRC benchmark test, the optimal meeting scores were 12 for both groups. On the spring VOC benchmark test, the optimal meeting scores were 15 for both groups.

Grade 8 results. For students in Grade 8, the optimal meeting scores on the easyCBM® fall PRF benchmark test were 166 CWPM for both groups. On the fall MCRC benchmark test, the optimal meeting scores were 15 for both groups. On the fall VOC benchmark test, the optimal meeting scores were 14 for both groups. The optimal meeting score on the easyCBM® winter PRF benchmark test was 156 CWPM for the first group and 159 CWPM for the second group. On the winter MCRC benchmark test, the optimal meeting scores were 13 for both groups. The optimal meeting scores on the easyCBM® spring PRF benchmark test were 160 CWPM for both groups. On the spring MCRC benchmark test, the optimal meeting scores were 14 and 13 for the first and the second group, respectively. On the spring VOC benchmark test, the optimal meeting scores were 16 for both groups.

The sensitivity and specificity statistics for all possible cut scores and the results of ROC analyses for the three reading easyCBM® measures are presented in the order of PRF, MCRC, and VOC, by grade, for both groups in Appendix B. The results are presented in the order of (a)

case processing summary, (b) area under curve statistics, (c) ROC curve figures, and (d) sensitivity and specificity statistics for each cut score. The determined optimal cut scores for each group are displayed in bold-faced font in the sensitivity and specificity tables.

Discussion

Overall, identified optimal cut scores appear quite stable across the two randomly split groups. Specifically, the average difference in cut scores for the easyCBM® PRF measure between groups was 1.50 CWPM for 18 grade-level and measurement occasion comparisons (6 grade levels, 3 measurement occasions at each grade). The average difference between cut scores for the MCRC and VOC measures was 0.44 and 0.17 for 18 and 12 grade-level and measurement occasion comparisons, respectively. Additionally, 95% confidence intervals for AUC statistics overlapped between groups for each measure type at all measurement occasions, indicating that observed differences in identified optimal cut scores between the two groups are non-significant. The consistency of optimal cut scores across measurement occasions for the two groups and the non-significant differences in AUC statistics at all measurement occasion and grades provide strong evidence for the validity of the cut scores derived.

Although identified optimal cut scores appear stable across the two groups used in the study, caution is warranted when extrapolating the actual *values* of identified cut scores. The identified cut scores were chosen using the Oregon state test as the criterion; a different criterion may well produce different optimal cut-scores. Performance standards vary from state to state, and we would expect the identified cut scores to differ based on the state test used (for example, see Anderson, Park, Irvin, Alonzo, & Tindal, 2011). However, given a common criterion, the results of this study indicate that the optimal cut-score is quite stable. Caution is also warranted when considering the identified optimal cut scores used in this study given that the sample,

although large, included only three districts within the state of Oregon. Identified optimal cut-scores could serve as a guide to districts within Oregon, but should not serve as a substitute for careful state- and district-level judgment of easyCBM[®] cut score identification and evaluation within high-stakes accountability systems.

Note. Numbers reflect full sample separated by District. However, during analyses students were excluded listwise and the actual demographics of students included varies by analysis. All values thus more accurately represent the Districts and sample, but not necessarily the analyses. Statistics are intended to provide only a general indication of the students included in the analyses.

ELL – English Language Learner, FRL – Free or reduced lunch eligible, SPED – Student receives special education services

 Appendix B: ROC Analyses

Grade 3
Fall PRF Benchmark
Case Processing Summary^b

Crossvalidation	OAKS_Perf	Valid N (listwise)
Group 1	Positive ^a	116
	Negative	961
	Missing	867
Group 2	Positive ^a	116
	Negative	952
	Missing	876

Smaller values of the test result variable(s) indicate stronger evidence for a positive actual state.

a. The positive actual state is .00.

b. For split file Crossvalidation = Group 2, the test variable(s): Fall09PRF has at least one tie between the positive actual state group and the negative actual state group.

Area Under the Curve^{c,d}

Test Result Variable(s):Fall09PRF

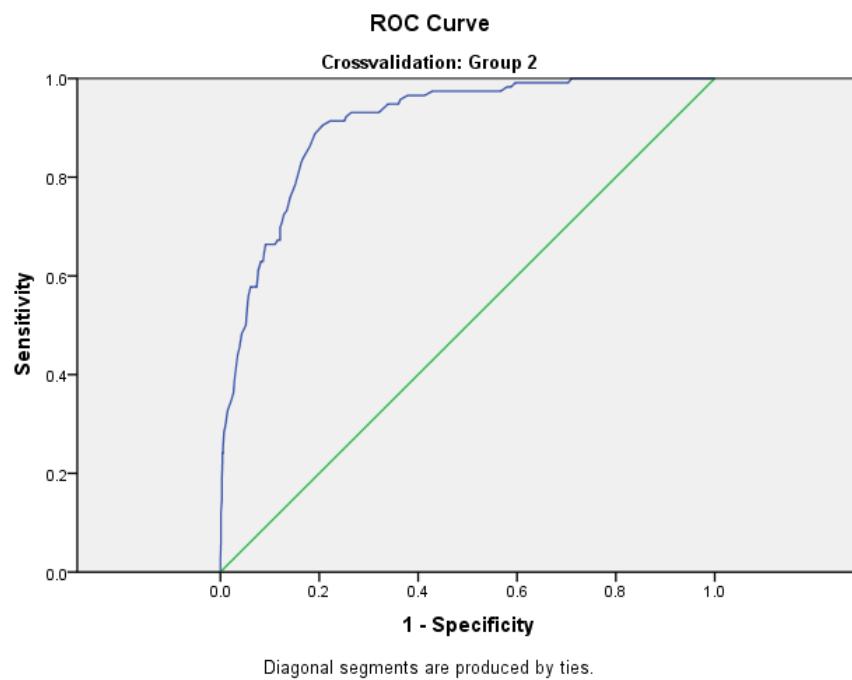

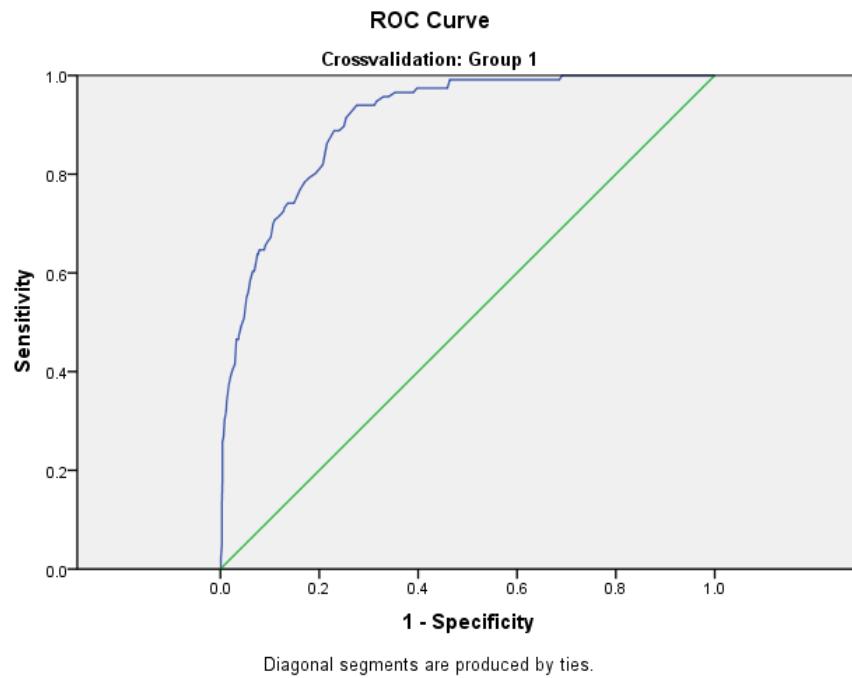

Crossvalidation	Area	Std. Error ^a	Asymptotic Sig. ^b	Asymptotic 95% Confidence Interval	
				Lower Bound	Upper Bound
Group 1	.908	.012	.000	.884	.932
Group 2	.907	.013	.000	.882	.932

a. Under the nonparametric assumption

b. Null hypothesis: true area = 0.5

c. For split file Crossvalidation = Group 1, the test result variable(s): Fall09PRF has at least one tie between the positive actual state group and the negative actual state group. Statistics may be biased.

d. For split file Crossvalidation = Group 2, the test result variable(s): Fall09PRF has at least one tie between the positive actual state group and the negative actual state group. Statistics may be biased.

Fall MCRC Benchmark

Case Processing Summary^b

Crossvalidation	OAKS_Perf	Valid N (listwise)
Group 1	Positive ^a	117
	Negative	1011
	Missing	816
Group 2	Positive ^a	120
	Negative	1004
	Missing	820

Smaller values of the test result variable(s) indicate stronger evidence for a positive actual state.

a. The positive actual state is .00.

b. For split file Crossvalidation = Group 2, the test variable(s): Fall09MCRC has at least one tie between the positive actual state group and the negative actual state group.

Area Under the Curve^{c,d}

Test Result Variable(s):Fall09MCRC

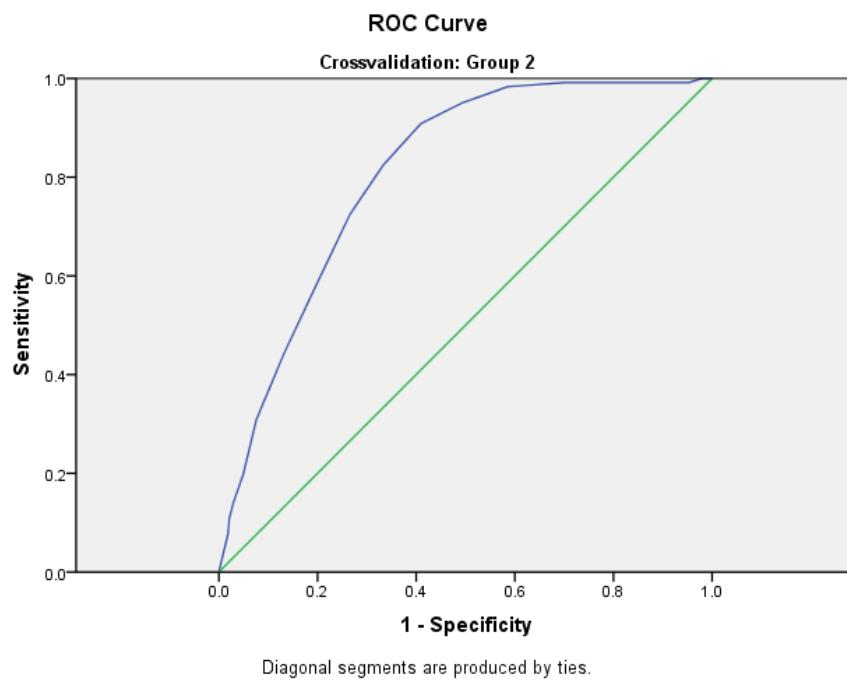

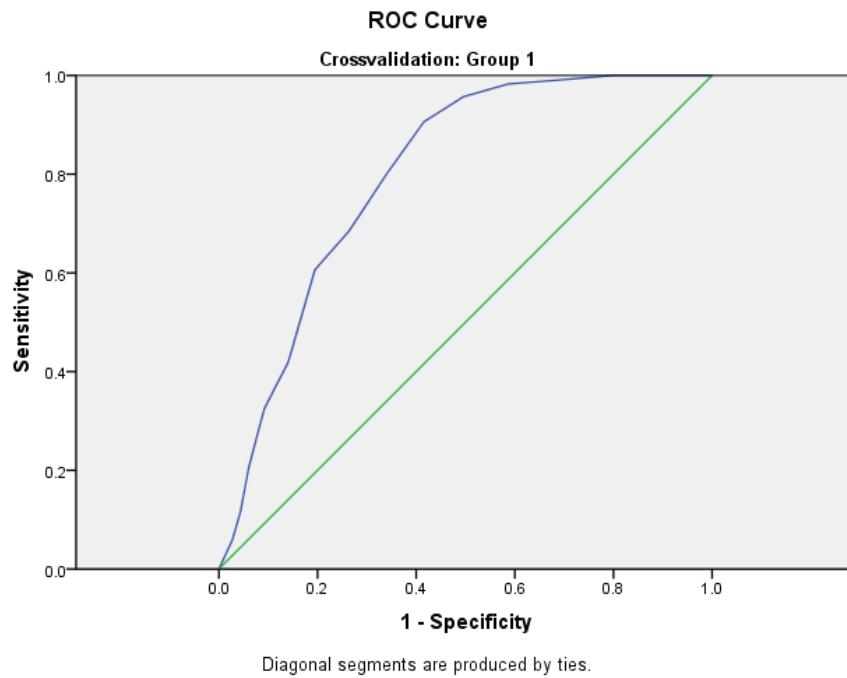

Crossvalidation	Area	Std. Error ^a	Asymptotic Sig. ^b	Asymptotic 95% Confidence Interval	
				Lower Bound	Upper Bound
Group 1	.799	.017	.000	.766	.832
Group 2	.808	.017	.000	.774	.841

a. Under the nonparametric assumption

b. Null hypothesis: true area = 0.5

c. For split file Crossvalidation = Group 1, the test result variable(s): Fall09MCRC has at least one tie between the positive actual state group and the negative actual state group. Statistics may be biased.

d. For split file Crossvalidation = Group 2, the test result variable(s): Fall09MCRC has at least one tie between the positive actual state group and the negative actual state group. Statistics may be biased.

Winter MCRC Benchmark

Case Processing Summary^b

Crossvalidation	OAKS_Perf	Valid N (listwise)
Group 1	Positive ^a	132
	Negative	1067
	Missing	745
Group 2	Positive ^a	128
	Negative	1064
	Missing	752

Smaller values of the test result variable(s) indicate stronger evidence for a positive actual state.

a. The positive actual state is .00.

b. For split file Crossvalidation = Group 2, the test variable(s): Wint10MCRC has at least one tie between the positive actual state group and the negative actual state group.

Area Under the Curve^{c,d}

Test Result Variable(s):Wint10MCRC

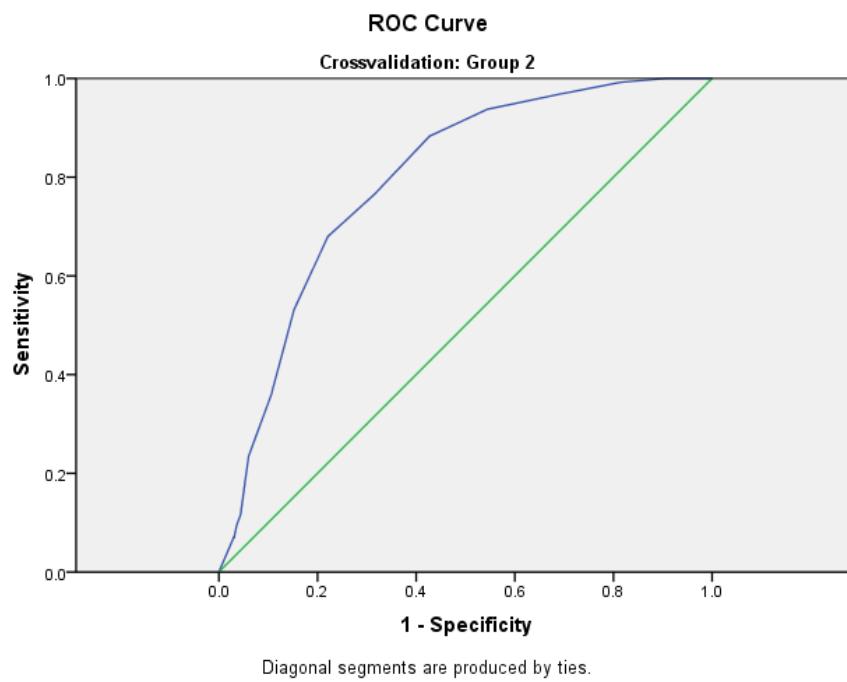

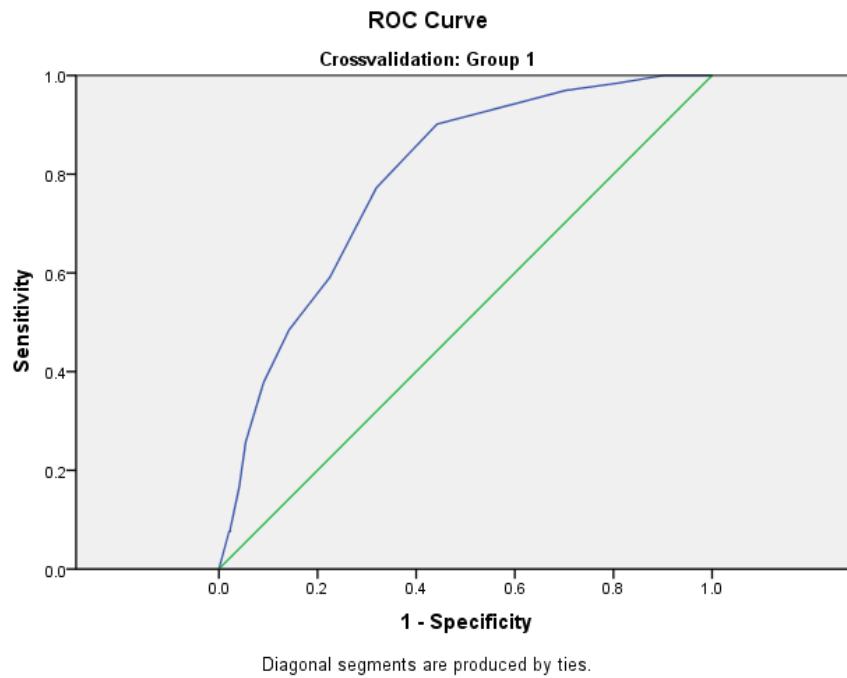

Crossvalidation	Area	Std. Error ^a	Asymptotic Sig. ^b	Asymptotic 95% Confidence Interval	
				Lower Bound	Upper Bound
Group 1	.789	.018	.000	.753	.825
Group 2	.794	.018	.000	.759	.829

a. Under the nonparametric assumption

b. Null hypothesis: true area = 0.5

c. For split file Crossvalidation = Group 1, the test result variable(s): Wint10MCRC has at least one tie between the positive actual state group and the negative actual state group. Statistics may be biased.

d. For split file Crossvalidation = Group 2, the test result variable(s): Wint10MCRC has at least one tie between the positive actual state group and the negative actual state group. Statistics may be biased.

Spring MCRC Benchmark

Case Processing Summary^b

Crossvalidation	OAKS_Perf	Valid N (listwise)
Group 1	Positive ^a	125
	Negative	1045
	Missing	774
Group 2	Positive ^a	123
	Negative	1021
	Missing	800

Smaller values of the test result variable(s) indicate stronger evidence for a positive actual state.

a. The positive actual state is .00.

b. For split file Crossvalidation = Group 2, the test variable(s): Spr10MCRC has at least one tie between the positive actual state group and the negative actual state group.

Area Under the Curve^{c,d}

Test Result Variable(s):Spr10MCRC

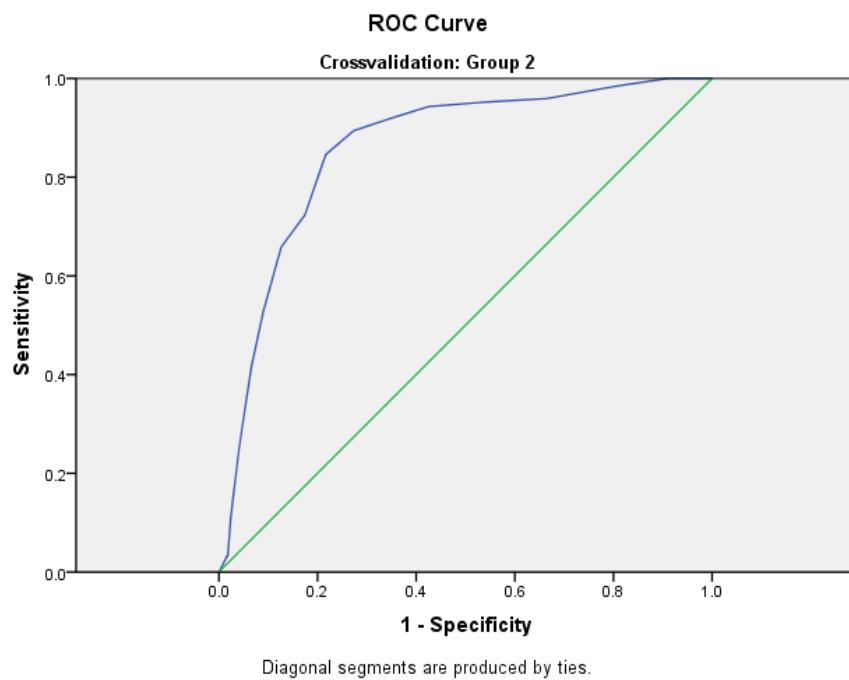

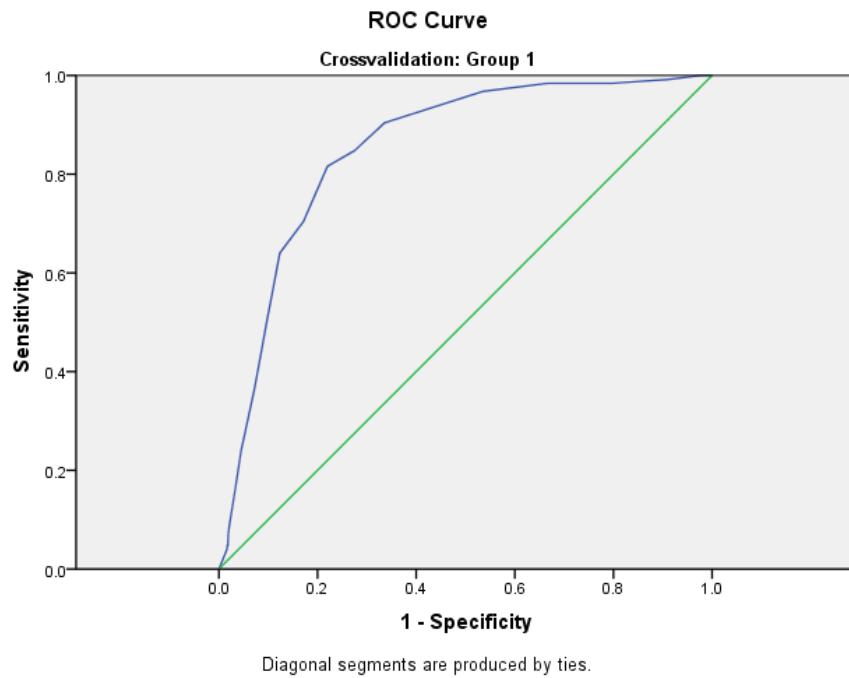

Crossvalidation	Area	Std. Error ^a	Asymptotic Sig. ^b	Asymptotic 95% Confidence Interval	
				Lower Bound	Upper Bound
Group 1	.851	.016	.000	.820	.882
Group 2	.859	.017	.000	.826	.891

a. Under the nonparametric assumption

b. Null hypothesis: true area = 0.5

c. For split file Crossvalidation = Group 1, the test result variable(s): Spr10MCRC has at least one tie between the positive actual state group and the negative actual state group. Statistics may be biased.

d. For split file Crossvalidation = Group 2, the test result variable(s): Spr10MCRC has at least one tie between the positive actual state group and the negative actual state group. Statistics may be biased.

Fall MCRC Benchmark

Case Processing Summary^b

Crossvalidation	OAKS_Perf	Valid N (listwise)
Group 1	Positive ^a	116
	Negative	1010
	Missing	744
Group 2	Positive ^a	117
	Negative	1001
	Missing	752

Smaller values of the test result variable(s) indicate stronger evidence for a positive actual state.

a. The positive actual state is .00.

b. For split file Crossvalidation = Group 2, the test variable(s): Fall09MCRC has at least one tie between the positive actual state group and the negative actual state group.

Area Under the Curve^{c,d}

Test Result Variable(s):Fall09MCRC

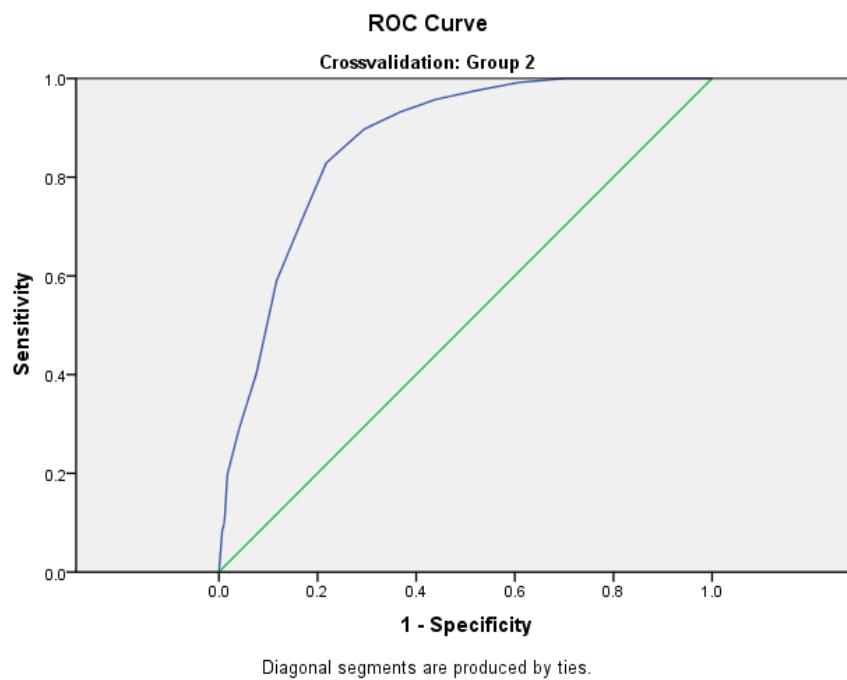

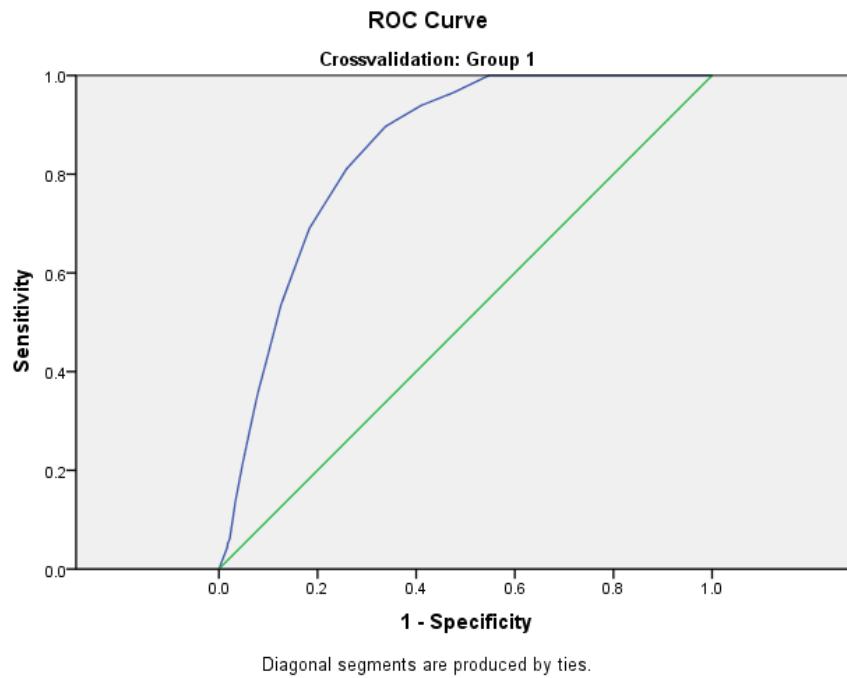

Crossvalidation	Area	Std. Error ^a	Asymptotic Sig. ^b	Asymptotic 95% Confidence Interval	
				Lower Bound	Upper Bound
Group 1	.845	.014	.000	.817	.873
Group 2	.868	.014	.000	.841	.896

a. Under the nonparametric assumption

b. Null hypothesis: true area = 0.5

c. For split file Crossvalidation = Group 1, the test result variable(s): Fall09MCRC has at least one tie between the positive actual state group and the negative actual state group. Statistics may be biased.

d. For split file Crossvalidation = Group 2, the test result variable(s): Fall09MCRC has at least one tie between the positive actual state group and the negative actual state group. Statistics may be biased.

a. Under the nonparametric assumption

b. Null hypothesis: true area = 0.5

c. For split file Crossvalidation = Group 1, the test result variable(s): Wint10PRF has at least one tie between the positive actual state group and the negative actual state group. Statistics may be biased.

d. For split file Crossvalidation = Group 2, the test result variable(s): Wint10PRF has at least one tie between the positive actual state group and the negative actual state group. Statistics may be biased.

	Missing	721
Group 2	Positive ^a	122
	Negative	1017
	Missing	731

Smaller values of the test result variable(s) indicate stronger evidence for a positive actual state.

a. The positive actual state is .00.

b. For split file Crossvalidation = Group 2, the test variable(s): Wint10MCRC has at least one tie between the positive actual state group and the negative actual state group.

Area Under the Curve^{c,d}

Grade 4
Spring MCRC Benchmark

Case Processing Summary^b

Crossvalidation	OAKS_Perf	Valid N (listwise)
Group 1	Positive ^a	122
	Negative	1023
	Missing	725
Group 2	Positive ^a	119
	Negative	1040
	Missing	711

Smaller values of the test result variable(s) indicate stronger evidence for a positive actual state.

a. The positive actual state is .00.

b. For split file Crossvalidation = Group 2, the test variable(s): Spr10MCRC has at least one tie between the positive actual state group and the negative actual state group.

Area Under the Curve^{c,d}

Test Result Variable(s):Spr10MCRC

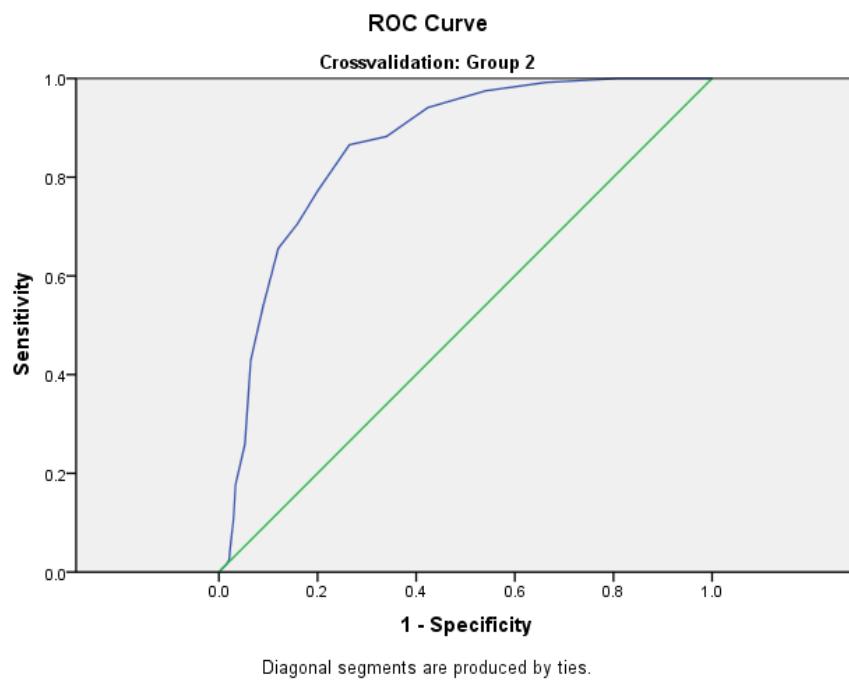

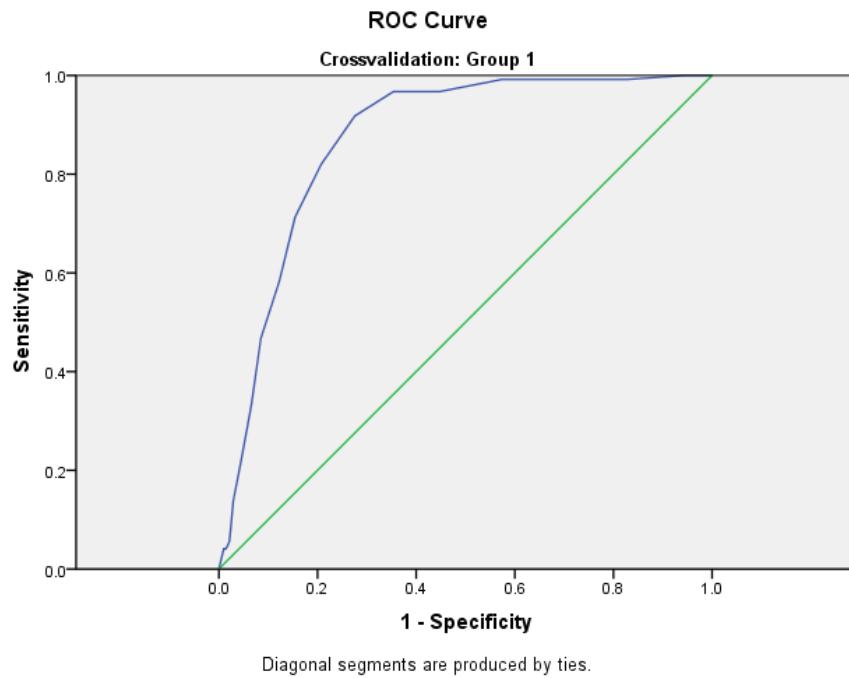

Crossvalidation	Area	Std. Error ^a	Asymptotic Sig. ^b	Asymptotic 95% Confidence Interval	
				Lower Bound	Upper Bound
Group 1	.870	.013	.000	.844	.896
Group 2	.861	.015	.000	.832	.890

a. Under the nonparametric assumption

b. Null hypothesis: true area = 0.5

c. For split file Crossvalidation = Group 1, the test result variable(s): Spr10MCRC has at least one tie between the positive actual state group and the negative actual state group. Statistics may be biased.

d. For split file Crossvalidation = Group 2, the test result variable(s): Spr10MCRC has at least one tie between the positive actual state group and the negative actual state group. Statistics may be biased.

Case Processing Summary^b

Crossvalidation	OAKS_Perf	Valid N (listwise)
Group 1	Positive ^a	188
	Negative	982
	Missing	755
Group 2	Positive ^a	203
	Negative	958
	Missing	765

Smaller values of the test result variable(s) indicate stronger evidence for a positive actual state.

a. The positive actual state is .00.

b. For split file Crossvalidation = Group 2, the test variable(s): Fall09PRF has at least one tie between the positive actual state group and the negative actual state group.

Area Under the Curve^{c,d}

Test Result Variable(s):Fall09PRF

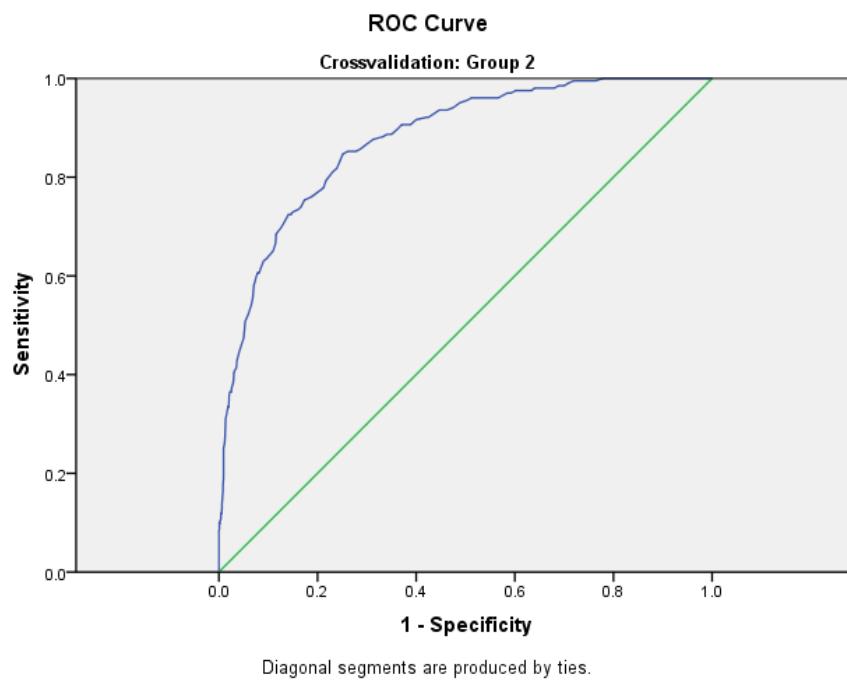

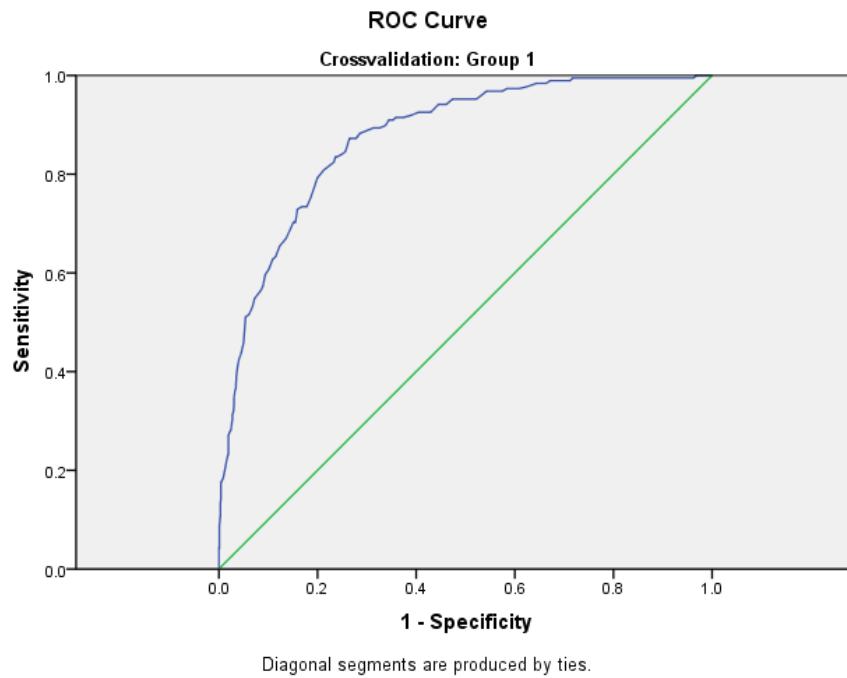

Crossvalidation	Area	Std. Error ^a	Asymptotic Sig. ^b	Asymptotic 95% Confidence Interval	
				Lower Bound	Upper Bound
Group 1	.874	.013	.000	.848	.900
Group 2	.877	.013	.000	.852	.902

a. Under the nonparametric assumption

b. Null hypothesis: true area = 0.5

c. For split file Crossvalidation = Group 1, the test result variable(s): Fall09PRF has at least one tie between the positive actual state group and the negative actual state group. Statistics may be biased.

d. For split file Crossvalidation = Group 2, the test result variable(s): Fall09PRF has at least one tie between the positive actual state group and the negative actual state group. Statistics may be biased.

Grade 5
Fall VOC Benchmark

Case Processing Summary^b

Crossvalidation	OAKS_Perf	Valid N (listwise)
Group 1	Positive ^a	169
	Negative	904
	Missing	852
Group 2	Positive ^a	183
	Negative	884
	Missing	859

Smaller values of the test result variable(s) indicate stronger evidence for a positive actual state.

a. The positive actual state is .00.

b. For split file Crossvalidation = Group 2, the test variable(s): Fall09Voc has at least one tie between the positive actual state group and the negative actual state group.

Area Under the Curve^{c,d}

Test Result Variable(s):Fall09Voc

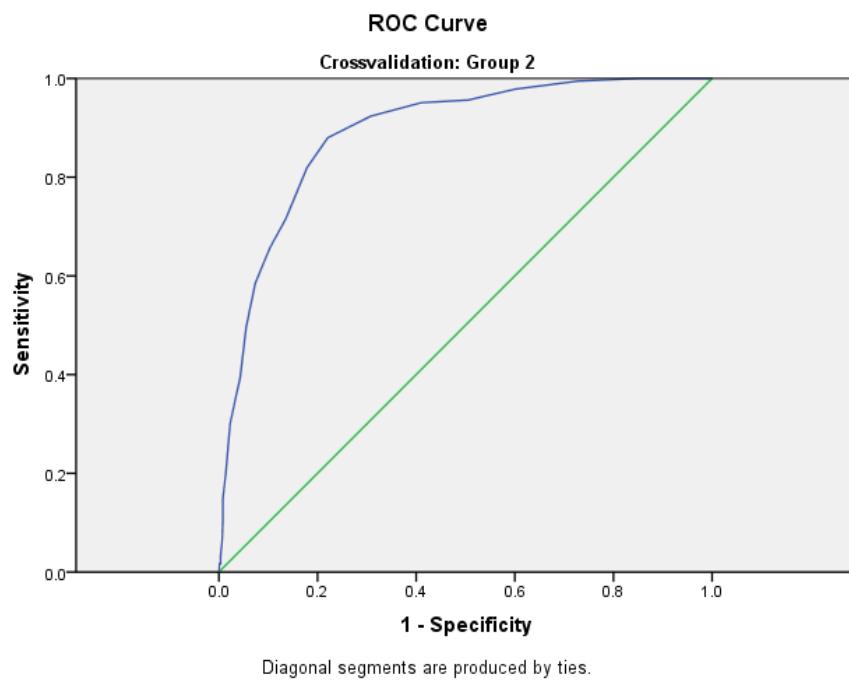

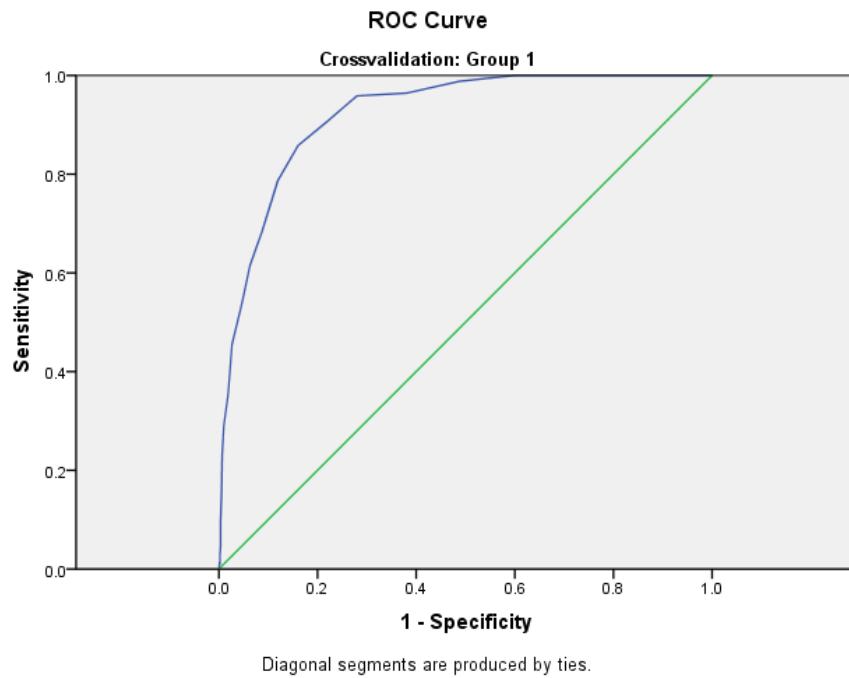

Crossvalidation	Area	Std. Error ^a	Asymptotic Sig. ^b	Asymptotic 95% Confidence Interval	
				Lower Bound	Upper Bound
Group 1	.921	.010	.000	.903	.940
Group 2	.890	.012	.000	.866	.914

a. Under the nonparametric assumption

b. Null hypothesis: true area = 0.5

c. For split file Crossvalidation = Group 1, the test result variable(s): Fall09Voc has at least one tie between the positive actual state group and the negative actual state group. Statistics may be biased.

d. For split file Crossvalidation = Group 2, the test result variable(s): Fall09Voc has at least one tie between the positive actual state group and the negative actual state group. Statistics may be biased.

Group 1	.880	.012	.000	.857	.903
Group 2	.834	.014	.000	.806	.862

a. Under the nonparametric assumption

b. Null hypothesis: true area = 0.5

c. For split file Crossvalidation = Group 1, the test result variable(s): Wint10MCRC has at least one tie between the positive actual state group and the negative actual state group. Statistics may be biased.

d. For split file Crossvalidation = Group 2, the test result variable(s): Wint10MCRC has at least one tie between the positive actual state group and the negative actual state group. Statistics may be biased.

Spring VOC Benchmark

Case Processing Summary^b

Crossvalidation	OAKS_Perf	Valid N (listwise)
Group 1	Positive ^a	172
	Negative	928
	Missing	825
Group 2	Positive ^a	186
	Negative	909
	Missing	831

Smaller values of the test result variable(s) indicate stronger evidence for a positive actual state.

a. The positive actual state is .00.

b. For split file Crossvalidation = Group 2, the test variable(s): Spr10Voc has at least one tie between the positive actual state group and the negative actual state group.

Area Under the Curve^{c,d}

Test Result Variable(s):Spr10Voc

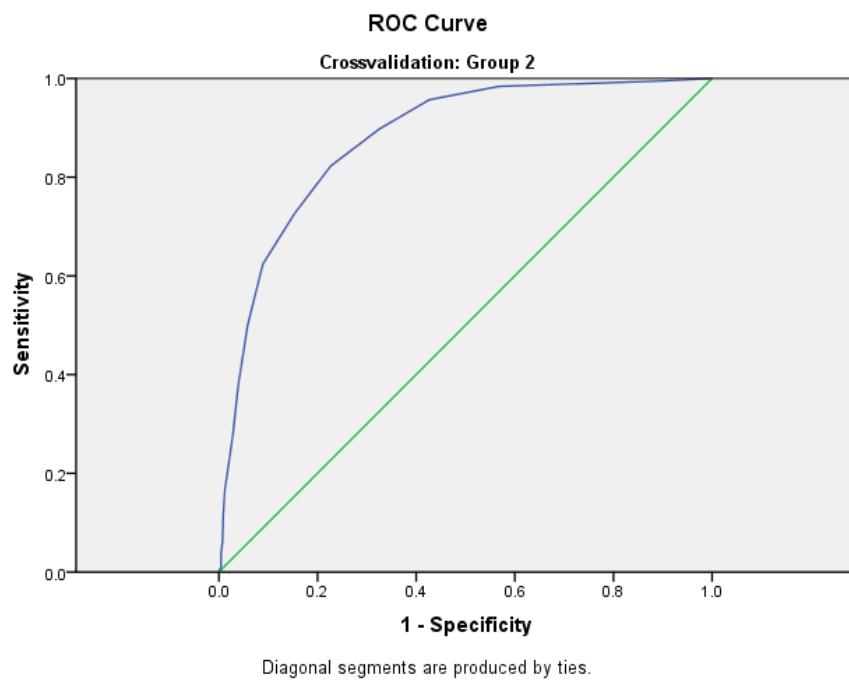

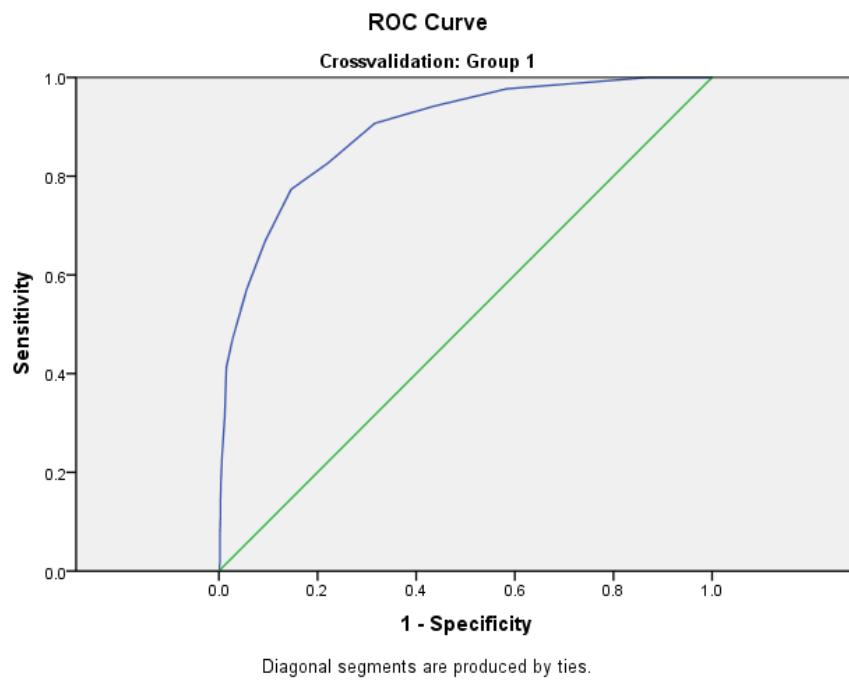

Crossvalidation	Area	Std. Error ^a	Asymptotic Sig. ^b	Asymptotic 95% Confidence Interval	
				Lower Bound	Upper Bound
Group 1	.893	.013	.000	.867	.918
Group 2	.878	.013	.000	.853	.903

a. Under the nonparametric assumption

b. Null hypothesis: true area = 0.5

c. For split file Crossvalidation = Group 1, the test result variable(s): Spr10Voc has at least one tie between the positive actual state group and the negative actual state group. Statistics may be biased.

d. For split file Crossvalidation = Group 2, the test result variable(s): Spr10Voc has at least one tie between the positive actual state group and the negative actual state group. Statistics may be biased.

Fall MCRC Benchmark

Case Processing Summary^b

Crossvalidation	OAKS_Perf	Valid N (listwise)
Group 1	Positive ^a	216
	Negative	939
	Missing	770
Group 2	Positive ^a	227
	Negative	927
	Missing	772

Smaller values of the test result variable(s) indicate stronger evidence for a positive actual state.

a. The positive actual state is .00.

b. For split file Crossvalidation = Group 2, the test variable(s): Fall09MCRC has at least one tie between the positive actual state group and the negative actual state group.

Test Result Variable(s):Fall09MCRC

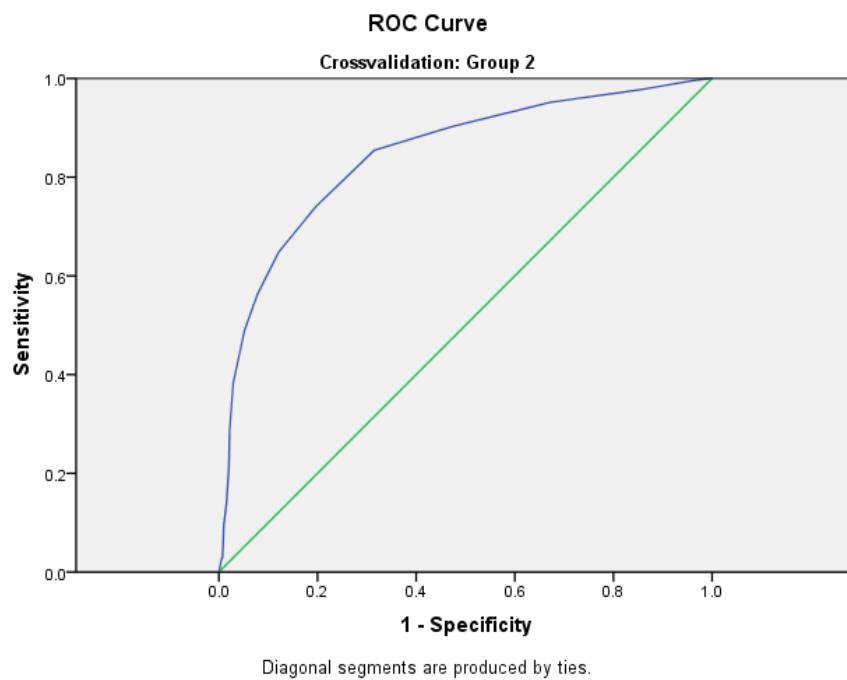

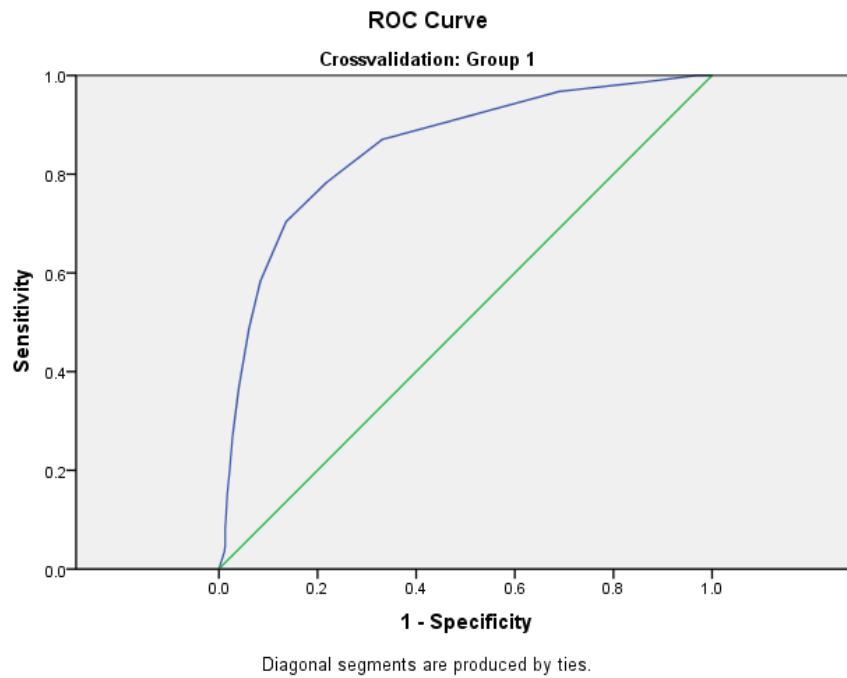

Crossvalidation	Area	Std. Error ^a	Asymptotic Sig. ^b	Asymptotic 95% Confidence Interval	
				Lower Bound	Upper Bound
Group 1	.851	.015	.000	.822	.880
Group 2	.845	.015	.000	.814	.875

a. Under the nonparametric assumption

b. Null hypothesis: true area = 0.5

c. For split file Crossvalidation = Group 1, the test result variable(s): Fall09MCRC has at least one tie between the positive actual state group and the negative actual state group. Statistics may be biased.

d. For split file Crossvalidation = Group 2, the test result variable(s): Fall09MCRC has at least one tie between the positive actual state group and the negative actual state group. Statistics may be biased.

Grade 6
Winter MCRC Benchmark

Case Processing Summary^b

Crossvalidation	OAKS_Perf	Valid N (listwise)
Group 1	Positive ^a	129
	Negative	490
	Missing	1306
Group 2	Positive ^a	142
	Negative	452
	Missing	1332

Smaller values of the test result variable(s) indicate stronger evidence for a positive actual state.

a. The positive actual state is .00.

b. For split file Crossvalidation = Group 2, the test variable(s): Wint10MCRC has at least one tie between the positive actual state group and the negative actual state group.

Area Under the Curve^{c,d}

Test Result Variable(s):Wint10MCRC

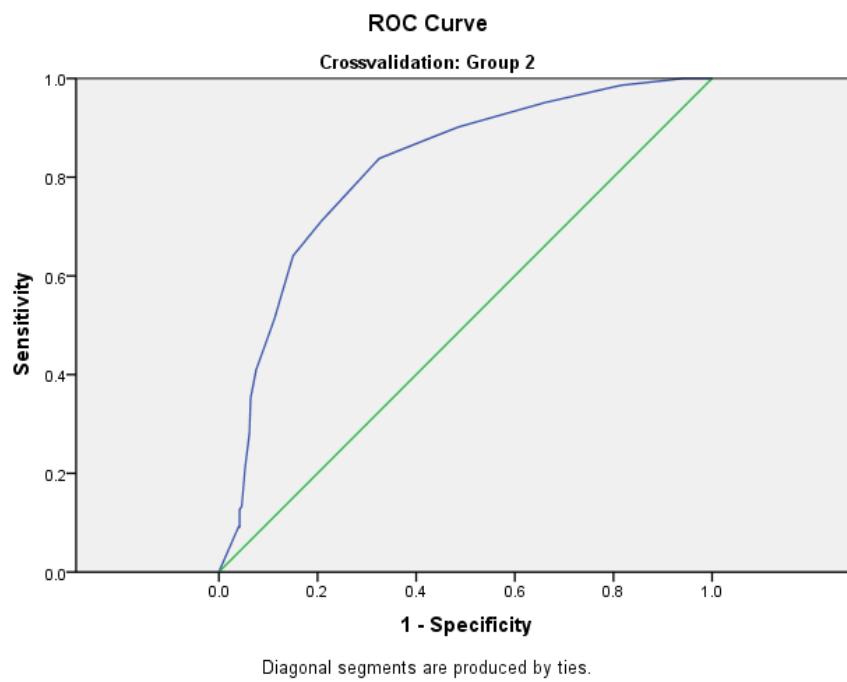

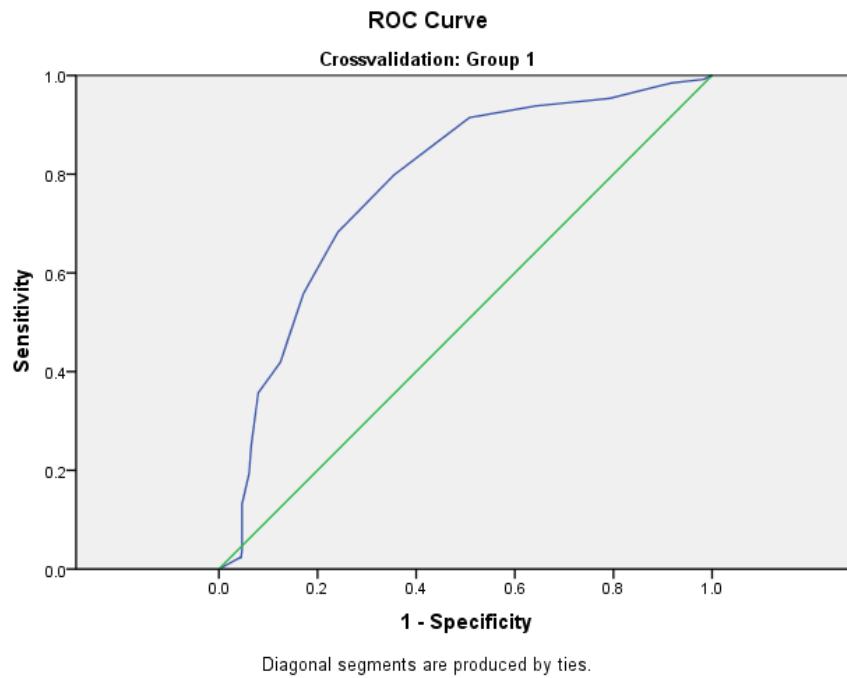

Crossvalidation	Area	Std. Error ^a	Asymptotic Sig. ^b	Asymptotic 95% Confidence Interval	
				Lower Bound	Upper Bound
Group 1	.776	.022	.000	.733	.820
Group 2	.815	.020	.000	.776	.854

a. Under the nonparametric assumption

b. Null hypothesis: true area = 0.5

c. For split file Crossvalidation = Group 1, the test result variable(s): Wint10MCRC has at least one tie between the positive actual state group and the negative actual state group. Statistics may be biased.

d. For split file Crossvalidation = Group 2, the test result variable(s): Wint10MCRC has at least one tie between the positive actual state group and the negative actual state group. Statistics may be biased.

Grade 6
Spring MCRC Benchmark

Case Processing Summary^b

Crossvalidation	OAKS_Perf	Valid N (listwise)
Group 1	Positive ^a	210
	Negative	890
	Missing	825
Group 2	Positive ^a	210
	Negative	898
	Missing	818

Smaller values of the test result variable(s) indicate stronger evidence for a positive actual state.

a. The positive actual state is .00.

b. For split file Crossvalidation = Group 2, the test variable(s): Spr10MCRC has at least one tie between the positive actual state group and the negative actual state group.

Area Under the Curve^{c,d}

Test Result Variable(s):Spr10MCRC

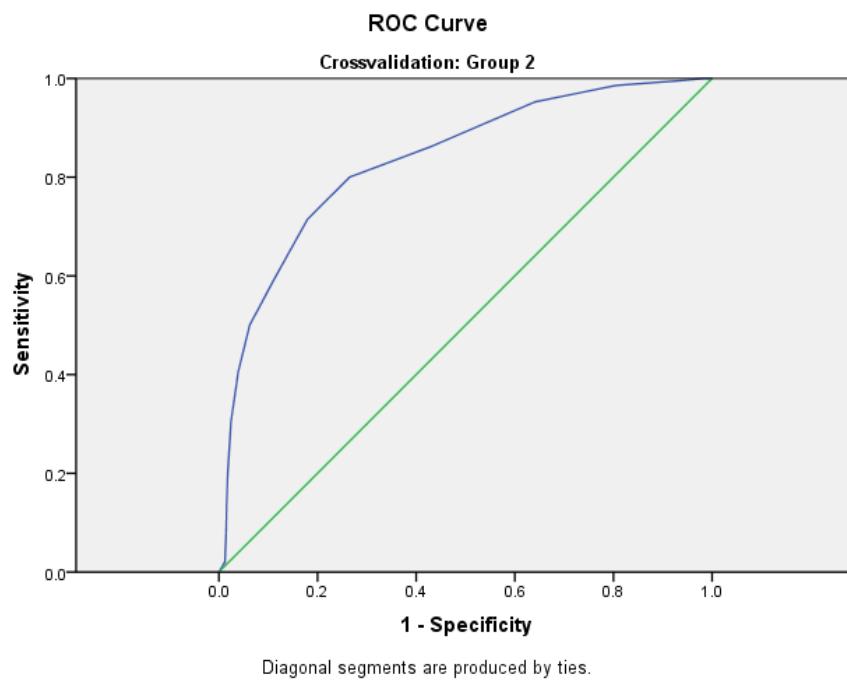

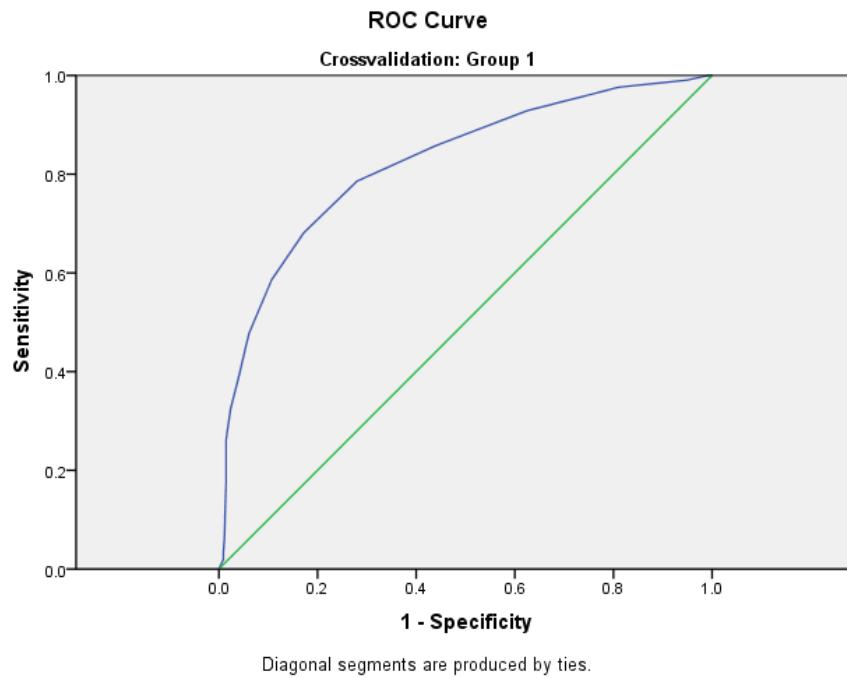

Crossvalidation	Area	Std. Error ^a	Asymptotic Sig. ^b	Asymptotic 95% Confidence Interval	
				Lower Bound	Upper Bound
Group 1	.823	.017	.000	.790	.857
Group 2	.835	.016	.000	.804	.866

a. Under the nonparametric assumption

b. Null hypothesis: true area = 0.5

c. For split file Crossvalidation = Group 1, the test result variable(s): Spr10MCRC has at least one tie between the positive actual state group and the negative actual state group. Statistics may be biased.

d. For split file Crossvalidation = Group 2, the test result variable(s): Spr10MCRC has at least one tie between the positive actual state group and the negative actual state group. Statistics may be biased.

Fall MCRC Benchmark

Case Processing Summary^b

Crossvalidation	OAKS_Perf	Valid N (listwise)
Group 1	Positive ^a	276
	Negative	1338
	Missing	186
Group 2	Positive ^a	280
	Negative	1311
	Missing	209

Smaller values of the test result variable(s) indicate stronger evidence for a positive actual state.

a. The positive actual state is .00.

b. For split file Crossvalidation = Group 2, the test variable(s): Fall09MCRC has at least one tie between the positive actual state group and the negative actual state group.

Area Under the Curve^{c,d}

Test Result Variable(s):Fall09MCRC

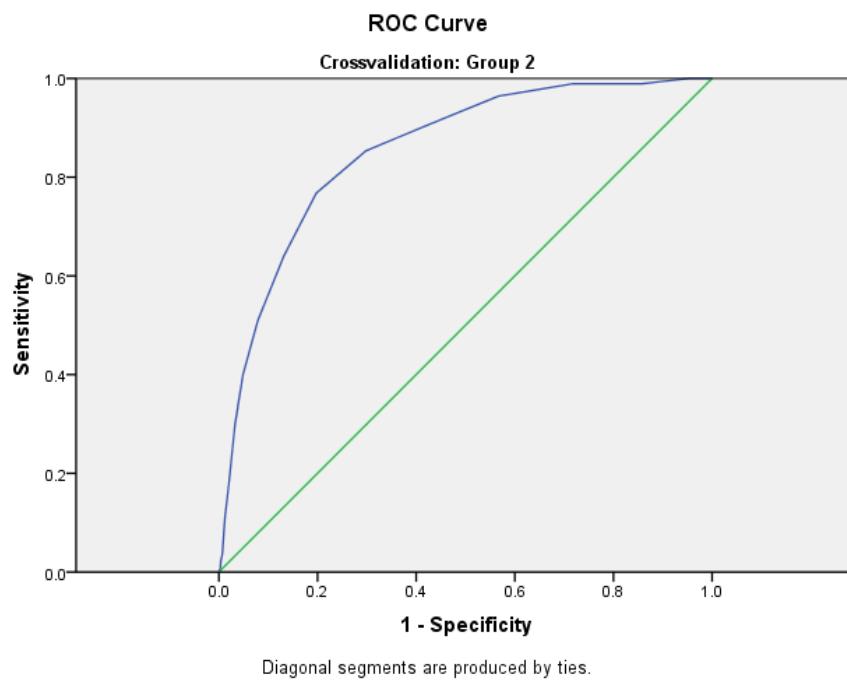

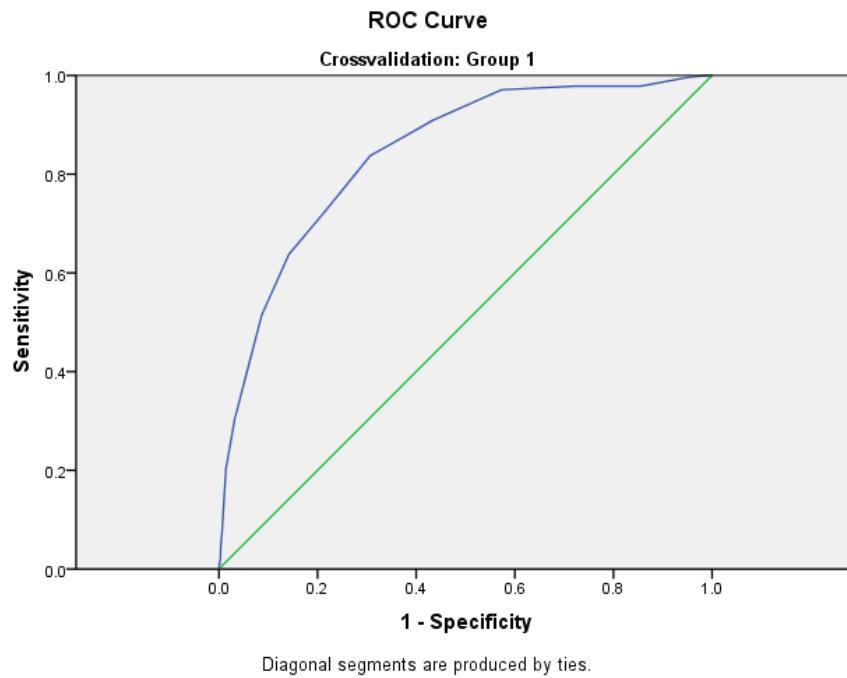

Crossvalidation	Area	Std. Error ^a	Asymptotic Sig. ^b	Asymptotic 95% Confidence Interval	
				Lower Bound	Upper Bound
Group 1	.842	.013	.000	.818	.867
Group 2	.854	.012	.000	.831	.877

a. Under the nonparametric assumption

b. Null hypothesis: true area = 0.5

c. For split file Crossvalidation = Group 1, the test result variable(s): Fall09MCRC has at least one tie between the positive actual state group and the negative actual state group. Statistics may be biased.

d. For split file Crossvalidation = Group 2, the test result variable(s): Fall09MCRC has at least one tie between the positive actual state group and the negative actual state group. Statistics may be biased.

Grade 7
Winter MCRC Benchmark

Case Processing Summary^b

Crossvalidation	OAKS_Perf	Valid N (listwise)
Group 1	Positive ^a	208
	Negative	819
	Missing	773
Group 2	Positive ^a	212
	Negative	811
	Missing	777

Smaller values of the test result variable(s) indicate stronger evidence for a positive actual state.

a. The positive actual state is .00.

b. For split file Crossvalidation = Group 2, the test variable(s): Wint10MCRC has at least one tie between the positive actual state group and the negative actual state group.

Area Under the Curve^{c,d}

Test Result Variable(s):Wint10MCRC

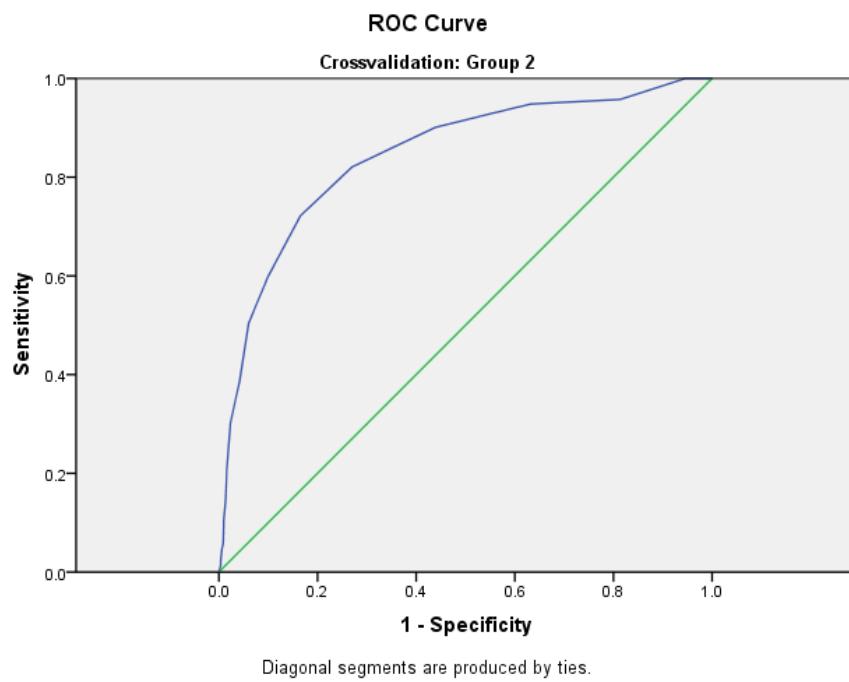

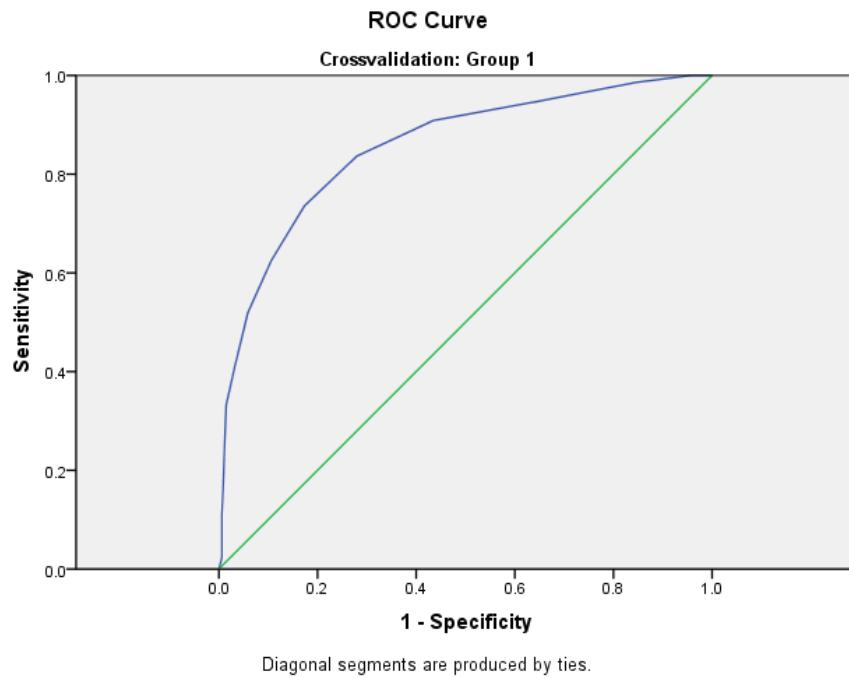

Crossvalidation	Area	Std. Error ^a	Asymptotic Sig. ^b	Asymptotic 95% Confidence Interval	
				Lower Bound	Upper Bound
Group 1	.855	.015	.000	.825	.885
Group 2	.844	.016	.000	.813	.875

a. Under the nonparametric assumption

b. Null hypothesis: true area = 0.5

c. For split file Crossvalidation = Group 1, the test result variable(s): Wint10MCRC has at least one tie between the positive actual state group and the negative actual state group. Statistics may be biased.

d. For split file Crossvalidation = Group 2, the test result variable(s): Wint10MCRC has at least one tie between the positive actual state group and the negative actual state group. Statistics may be biased.

Spring MCRC Benchmark

Case Processing Summary^b

Crossvalidation	OAKS_Perf	Valid N (listwise)
Group 1	Positive ^a	290
	Negative	1350
	Missing	160
Group 2	Positive ^a	288
	Negative	1322
	Missing	190

Smaller values of the test result variable(s) indicate stronger evidence for a positive actual state.

a. The positive actual state is .00.

b. For split file Crossvalidation = Group 2, the test variable(s): Spr10MCRC has at least one tie between the positive actual state group and the negative actual state group.

Area Under the Curve^{c,d}

Test Result Variable(s):Spr10MCRC

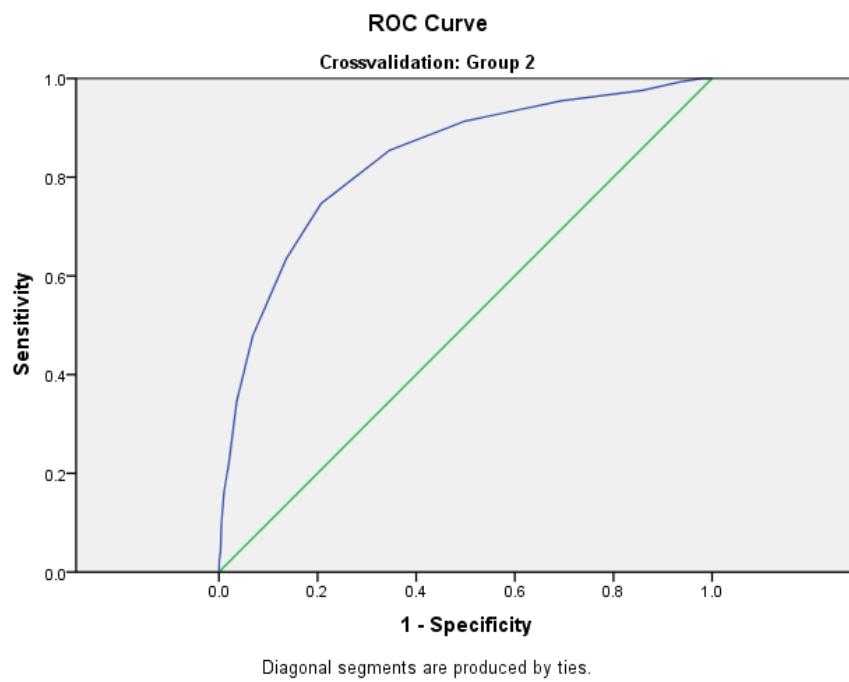

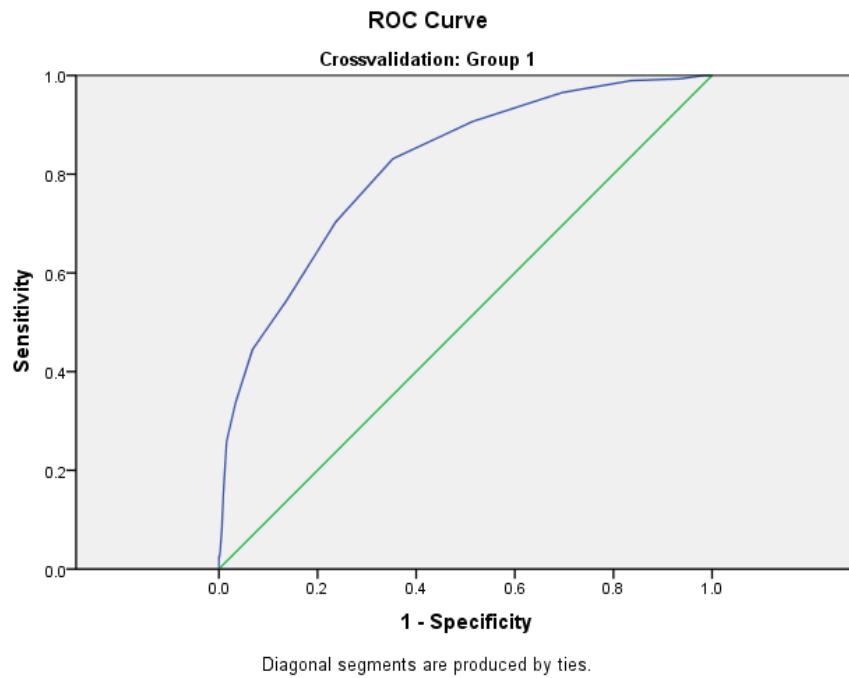

Crossvalidation	Area	Std. Error ^a	Asymptotic Sig. ^b	Asymptotic 95% Confidence Interval	
				Lower Bound	Upper Bound
Group 1	.816	.014	.000	.790	.843
Group 2	.835	.014	.000	.808	.861

a. Under the nonparametric assumption

b. Null hypothesis: true area = 0.5

c. For split file Crossvalidation = Group 1, the test result variable(s): Spr10MCRC has at least one tie between the positive actual state group and the negative actual state group. Statistics may be biased.

d. For split file Crossvalidation = Group 2, the test result variable(s): Spr10MCRC has at least one tie between the positive actual state group and the negative actual state group. Statistics may be biased.

Case Processing Summary^b

Crossvalidation	OAKS_Perf	Valid N (listwise)
Group 1	Positive ^a	478
	Negative	1190
	Missing	206
Group 2	Positive ^a	487
	Negative	1185
	Missing	203

Smaller values of the test result variable(s) indicate stronger evidence for a positive actual state.

a. The positive actual state is .00.

b. For split file Crossvalidation = Group 2, the test variable(s): easyCBM Multiple Choice Read Comp Score Grade 8 Fall has at least one tie between the positive actual state group and the negative actual state group.

Area Under the Curve^{c,d}

Test Result Variable(s):easyCBM Multiple Choice Read Comp Score Grade 8 Fall

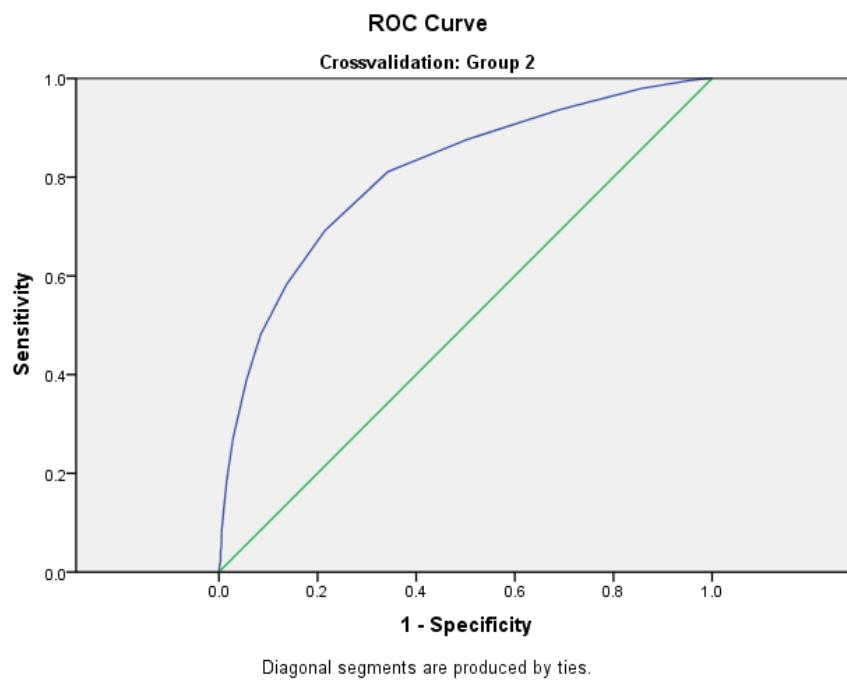

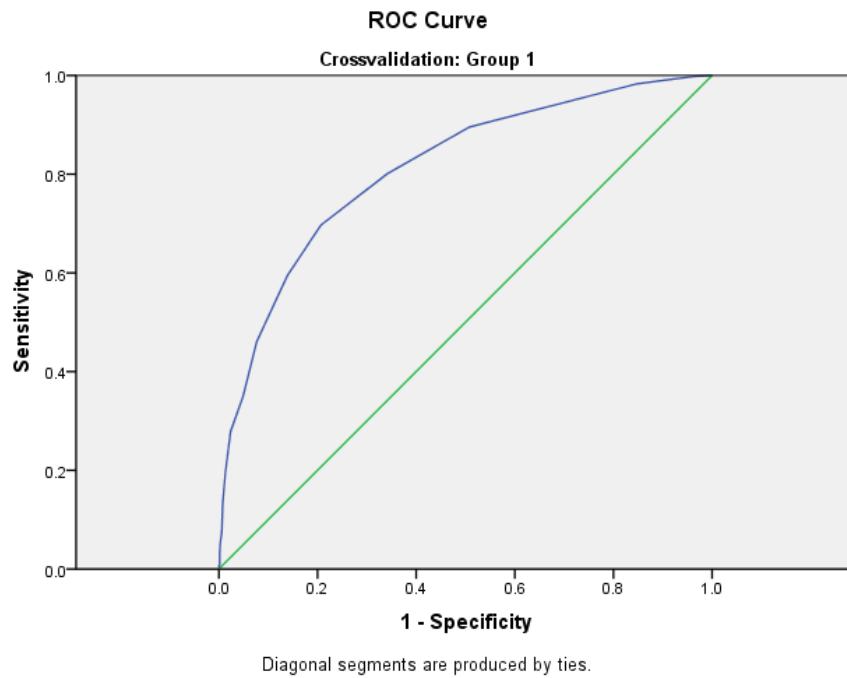

Crossvalidation	Area	Std. Error ^a	Asymptotic Sig. ^b	Asymptotic 95% Confidence Interval	
				Lower Bound	Upper Bound
Group 1	.812	.012	.000	.789	.835
Group 2	.806	.012	.000	.782	.829

a. Under the nonparametric assumption

b. Null hypothesis: true area = 0.5

c. For split file Crossvalidation = Group 1, the test result variable(s): easyCBM Multiple Choice Read Comp Score Grade 8 Fall has at least one tie between the positive actual state group and the negative actual state group. Statistics may be biased.

d. For split file Crossvalidation = Group 2, the test result variable(s): easyCBM Multiple Choice Read Comp Score Grade 8 Fall has at least one tie between the positive actual state group and the negative actual state group. Statistics may be biased.

Group 1	Positive ^a	356
	Negative	718
	Missing	800
Group 2	Positive ^a	362
	Negative	669
	Missing	844

Smaller values of the test result variable(s) indicate stronger evidence for a positive actual state.

a. The positive actual state is .00.

b. For split file Crossvalidation = Group 2, the test variable(s): easyCBM Multiple Choice Read Comp Score Grade 8 Winter has at least one tie between the positive actual state group and the negative actual state group.

Area Under the Curve^{c,d}

Test Result Variable(s):easyCBM Multiple Choice Read Comp Score Grade 8 Winter

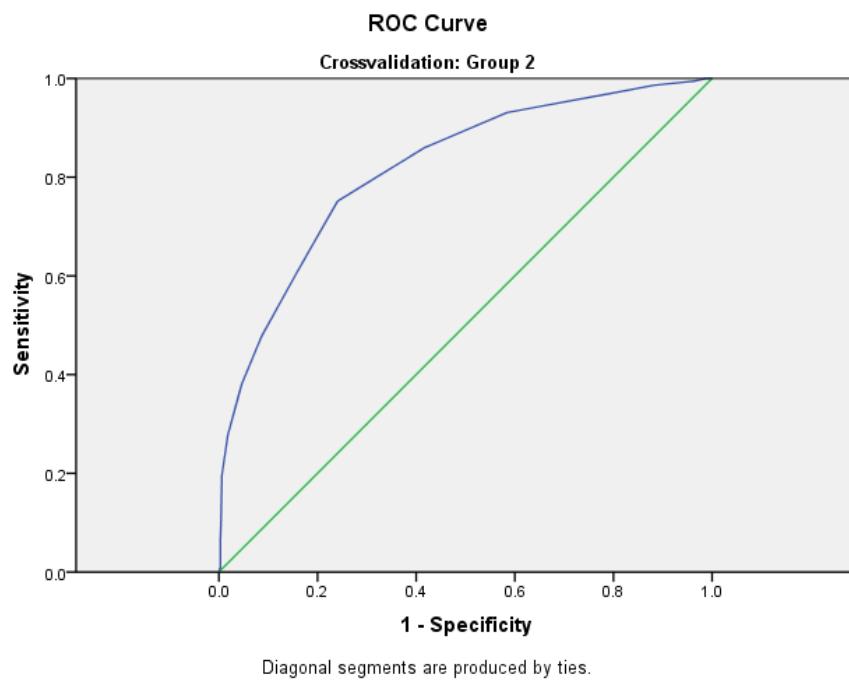

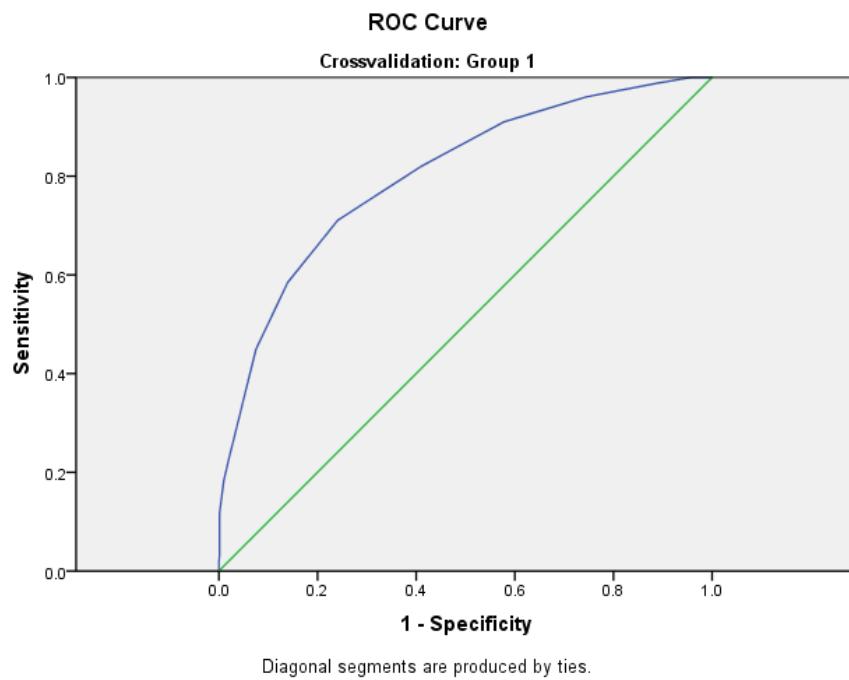

Crossvalidation	Area	Std. Error ^a	Asymptotic Sig. ^b	Asymptotic 95% Confidence Interval

Case Processing Summary^b

Crossvalidation	OAKS_Perf	Valid N (listwise)
Group 1	Positive ^a	487
	Negative	1189
	Missing	198
Group 2	Positive ^a	491
	Negative	1185
	Missing	199

Smaller values of the test result variable(s) indicate stronger evidence for a positive actual state.

a. The positive actual state is .00.

b. For split file Crossvalidation = Group 2, the test variable(s): easyCBM Multiple Choice Reading Comprehension Score Grade 8 Spring has at least one tie between the positive actual state group and the negative actual state group.

Area Under the Curve^{c,d}

Test Result Variable(s):easyCBM Multiple Choice Reading Comprehension Score Grade 8 Spring

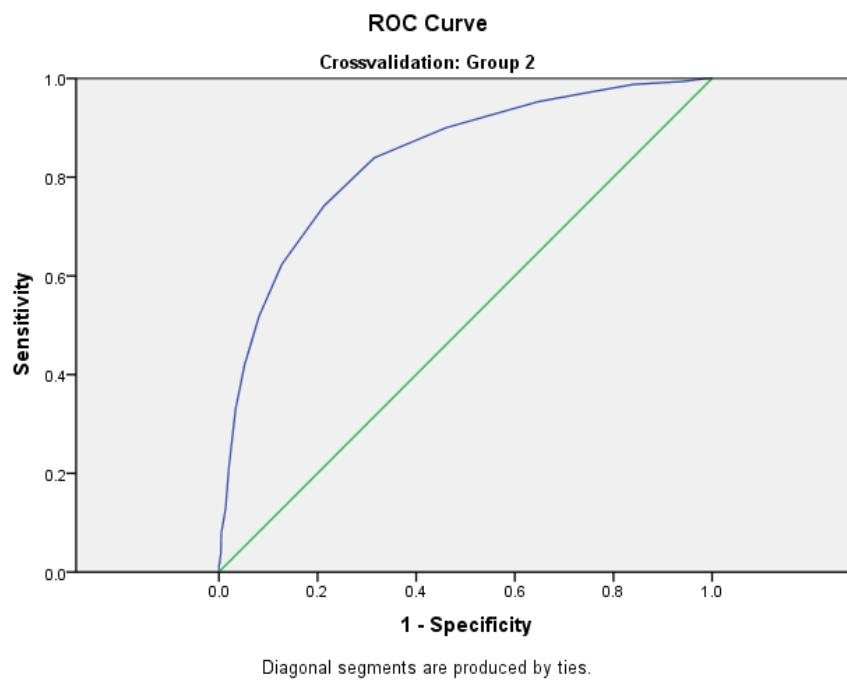

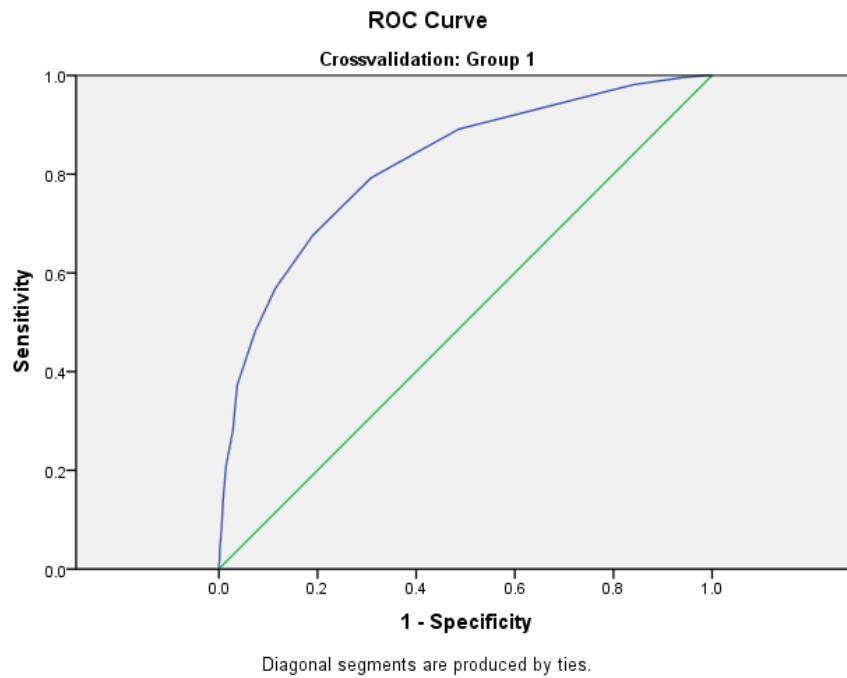

Crossvalidation	Area	Std. Error ^a	Asymptotic Sig. ^b	Asymptotic 95% Confidence Interval	
				Lower Bound	Upper Bound
Group 1	.818	.012	.000	.796	.841
Group 2	.837	.011	.000	.816	.858

a. Under the nonparametric assumption

b. Null hypothesis: true area = 0.5

c. For split file Crossvalidation = Group 1, the test result variable(s): easyCBM Multiple Choice Reading Comprehension Score Grade 8 Spring has at least one tie between the positive actual state group and the negative actual state group. Statistics may be biased.

d. For split file Crossvalidation = Group 2, the test result variable(s): easyCBM Multiple Choice Reading Comprehension Score Grade 8 Spring has at least one tie between the positive actual state group and the negative actual state group. Statistics may be biased.
