Abstract

This report presents normative data for the easyCBM reading and mathematics assessment system, designed for students in Grades K–8 to support academic screening and progress monitoring. The normative indices provide educators with reliable benchmarks for identifying students at risk for academic difficulties, setting growth targets, and evaluating progress over time. Data from the 2024–2025 academic year were drawn from valid easyCBM school district accounts, with strict inclusion criteria applied to ensure score validity and consistency. A data selection process prioritized districts with comprehensive testing coverage, followed by stratified sampling to ensure geographic representation across four U.S. regions. The report includes sample demographics, measure score descriptive statistics, and resulting normative tables to guide appropriate interpretation and use of the easyCBM assessment system.

Introduction

This report presents normative data for easyCBM, a reading and mathematics assessment system used in Grades K through 8 for academic screening and progress monitoring. easyBM offers brief, reliable indicators of student performance aligned with core academic skills. These normative indices can support educators in identifying students at risk for academic difficulties, setting growth goals, and evaluating student academic progress over time.

The following sections detail the data selection procedures, statistical method, sample demographics, measure score descriptive statistics, and resulting normative tables to guide appropriate interpretation and use of the assessment system.

Procedures

Data were from the 2024-2025 academic year from valid easyCBM school district accounts. Students were included in the data if they had at least one benchmark score from the target measure and grade that was not excluded for any of the following reasons.

- Students were excluded if they received benchmark testing on more than one grade level of measures during the 2024-2025 academic year.
- Scores were excluded if the test was not marked as completed (only applied to student online testing).
- Scores were excluded if they were below zero or above the official maximum score for that measure, grade, and season.
- Missing scores were excluded.
- Scores were excluded if they fell outside the following designated date ranges for each season.
 - Fall: August 1 through October 15
 - Winter: December 1 to February 15
 - Spring: March 15 to June 15

Rapid Automatized Naming (RAN) and Spanish Measures

Because data was sparse for easyCBM Rapid Automatized Naming (RAN) and Spanish measures, all remaining data after the previously described procedures was used for the normative samples.

Reading and Mathematics Measures

For easyCBM reading and mathematics measures, a conceptual data selection procedure was applied in an attempt to identify school districts where all or most students were tested on a measure. For Grades K through 7, we removed districts/measures/grades/seasons that were $< 50\%$ of the maximum number of students tested for a district's sample

of measures/grades/seasons across Grade K through 7. For Grade 8, we removed districts/measures/grades/seasons that were $\geq 50\%$ and $\leq 133\%$ of the maximum number of students tested for a district's sample of measures/grades/seasons in Grade 8.

Stratification

Subsequently, a stratified sampling approach was used to ensure representation across four predefined geographic regions of the United States. See the *States by Region* table below. Each region served as a stratum, from which a target sample of 500 students was selected, for a total intended sample size of 5,000 students. Within each region, students were randomly sampled without replacement. In cases where the total number of students in a region was fewer than 500, all available students from that region were included in the sample. This approach ensured that each region contributed proportionately to the sample, while also accommodating constraints in smaller populations.

WI	–	–	–

Method

All normative percentiles were estimated with an empirical cumulative distribution function (ECDF; `ecdf` function from the R `{stats}` package), a non-parametric estimator of the cumulative distribution function of the data samples for a measure, grade, season. The ECDF shows the proportion of observations in a sample that are less than or equal to a given value.

Estimated percentiles were rounded to the nearest integer, and the percentile ceiling was constrained to be equal to 99.

All analyses and figures were conducted and created in the R programming environment (R Core Team 2024a) with the following R packages: `data.table` (Barrett et al. 2024); `knitr` (Xie 2024); `moments` (Komsta and Novomestky 2022); `readxl` (Wickham and Bryan 2023); `stats` (R Core Team 2024b); and `tidyverse` (Wickham et al. 2019).

Reading Composite

The Reading Composite is composed of three reading measures at each grade and season. See the table below for the easyCBM measures in the Reading Composite by grade and season.

easyCBM Measures in the Reading Composite by Grade and Season

Grade - Season	Measure		
	1	2	3
Grade K - Fall	Letter Names	Letter Sounds	Phoneme Segmenting
Grade K - Winter	Letter Sounds	Phoneme Segmenting	Word Reading Fluency
Grade K - Spring	Letter Sounds	Phoneme Segmenting	Word Reading Fluency
Grade 1 - Fall	Letter Sounds	Phoneme Segmenting	Word Reading Fluency
Grade 1 - Winter	Letter Sounds	Passage Reading Fluency	Word Reading Fluency
Grade 1 - Spring	Letter Sounds	Passage Reading Fluency	Word Reading Fluency
Grade 2 - Fall	Proficient Reading	Passage Reading Fluency	Vocabulary
Grade 2 - Winter	Proficient Reading	Passage Reading Fluency	Vocabulary

Grade 8 - Fall	Proficient Reading	Passage Reading Fluency	Vocabulary
Grade 8 - Winter	Proficient Reading	Passage Reading Fluency	Vocabulary
Grade 8 - Spring	Proficient Reading	Passage Reading Fluency	Vocabulary

When a student is tested on all three measures, the Reading Composite percentile is computed as follows.

- (1) The *mean* and *SD* for each of the three easyCBM measures are used to calculate three individual *z*-scores, one for each measure: $(score_{student} - Mean_{measure})/SD_{measure}$.
 - The easyCBM measure average is subtracted from the student's score, then divided by the standard deviation.

- A z -score is a way of calculating how far from the average student's score is, measured in a standard way that allows comparison across different scales.
- (2) The average of those three z -scores is computed.
 - (3) This z -score average can then be directly mapped to a percentile by using the shape of the normal distribution. To convert that into a percentile, we use a quantile function (`stats::qnorm()` in R) to calculate the proportion of the distribution that lies below that z -score.
 - For example, a z -score of 0 is right at the middle of the distribution, which corresponds to the 50th percentile. A z -score of +1.0 is one standard deviation above average and corresponds to roughly the 84th percentile, meaning the score is higher than about 84% of all values.

In the sections that follow, we first present a table that shows all percentiles (1 to 99) and the corresponding z -scores, which is appropriate for all Reading Composite measures in each grade and season, then then follow with the descriptive score statistics (*Mean* and standard deviation (*SD*)) for the three easyCBM measures used in the Reading Composite for each grade and season.
